

The Cyperaceae of Micronesia

Tetsuo KOYAMA

The New York Botanical Garden, N. Y.

Abstract

The Cyperaceae of Micronesia includes 67 species of 13 genera. These consist of Pacific, Malaysian and Pantropic elements in almost equal proportions. Based on a review of all major collections concerned, these species are enumerated with taxonomic discussion, and keys to genera and species are provided. In addition to numerous nomenclatural revisions the following new names and new combinations are proposed: *Mapania pandanophylla* ssp. *immensa*, *Mapania flavinux*, *Mapania parvibractea*, *Hypolytrum nemorum* ssp. *vitiense*, *Scirpus littoralis* ssp. *thermalis*, *Eleocharis congesta* ssp. *subvivipara*, *Fimbristylis cymosa* ssp. *umbellato-capitata*, *Fimbristylis cymosa* ssp. *spathacea*, *Fimbristylis dichotoma* ssp. *podocarpa*, *Machaerina mariscoidea* ssp. *colpodes*, *Schoenus tendo* ssp. *achaetus*, *Rhynchospora rugosa* ssp. *lavarum* forma *ponapensis*, and *Carex brunnea* ssp. *Meyenii*.

Introduction

This paper deals with a taxonomic study of the Cyperaceae hitherto recorded from Micronesia. A total of 67 species that I recognize to be valid are classified into 13 genera in accordance with a system proposed in my previous paper (T. Koyama 1961). Detailed comparison of these species with those of Malaysia, Polynesia, Australia, New Zealand and the Hawaiian Islands does not support the high degree of endemism of Micronesian Cyperaceae that had been suggested by previous Japanese investigators. More than two thirds of the total number of species appear to have migrated from Malaysia. Micronesia without doubt is one of the better botanized areas in the tropical Pacific. The ample collections were, however, scattered in several distant herbaria, resulting in a lack of any comprehensive study of this vast family in this area. My aim of visiting such herbaria since 1958 was to bring all data concerning the Micronesian Cyperaceae together in order that we may have an accurate entire picture of this important and predominant component of the Micronesian flora.

Historical Summary and Sources of Material

As early as 1828 Presl described *Fimbristylis affinis* from the Marianna Islands in his *Reliquiae Haenkeanae*, Vol. I. In 1829 Gaudichaud described *Fimbristylis marianna*, *F. littoralis*, *Baumea mariscoidea* and *Hypolytrum macrocephalum* from various parts of Micronesia as the result of Freycinet's botanical exploration. His species were later cited by K. Schumann in his flora (1900).

More records of the occurrence of the species of Cyperaceae in Micronesia appear in the regional lists such as that of the Carolines by Volkens (1902), and

of Guam by Safford (1905) and Merrill (1914). The Cyperaceae known at that time were included in the collections of Ledermann, Volkens, Gibbon, and the collectors of the Guam Experiment Station, besides the historical specimens mentioned above. Almost all of these Cyperaceae were studied by Küenthal (1924).

Ample collections were then made by several Japanese botanists over some 12 years from about 1930. They are Kanehira and Hatusima's collections in Fukuoka, Hosokawa's collection in Taipei, Tuyama's collection in Tokyo and a few other small ones. Ohwi (1942) studied all the Cyperaceae of the first collection, while Hosokawa treated some of his own collection in his series of tropical papers (1935-40). Tuyama's collection like a few others has been left unstudied.

The latest and the most extensive collections are those of the United States botanists. The University of Hawaii-Bishop Museum group including H. St. John and E. H. Bryan, Jr. deposited their collections at the herbarium of the Bernice P. Bishop Museum in Honolulu. The master sheets of F. R. Fosberg's collections for his Pacific Vegetation Project are available at the Smithsonian Institution. The College of Guam at Agana has established a Micronesian herbarium, and Cyperaceae duplicates were sent to the Plant Research Institute in Ottawa by B. C. Stone while I was at the Institute. The majority of these collections are first cited in this paper.

The following are the herbaria in which the related specimens are deposited:

B	Botanischer Garten und Museum, Berlin-Dahlem. Ledermann, Volkens, Gibbon.
BISH	Bernice P. Bishop Museum, Honolulu. St.-John, Bryan, Jr., Stone, Wagner, Jr., Takamatsu, Fosberg, Hosokawa.
DAO	Plant Research Institute, Canada Department of Agriculture, Ottawa. Stone and his students.
FU	Faculty of Agriculture, Kyushu University, Fukuoka. Kanehira, Kanehira & Hatusima, Hatusima.
GUAM	College of Guam Herbarium, Agana, Guam. Stone, and his students.
K	Royal Botanic Gardens, Kew. Ledermann.
KAG	Faculty of Agriculture, Kagoshima University, Kogoshima. Kawagoe.
NY	The New York Botanical Garden, New York. Guam Experiment Sta., Kanehira.
P	Muséum National d'Histoire Naturelle, Paris. Gaudichaud.
TAI	Department of Botany, Faculty of Science, National Taiwan University, Taipei. Hosokawa.
TI	Department of Botany, Faculty of Science, University of Tokyo, Tokyo. Tuyama, Koidzumi, Momose, Kamiya.
US	United States National Herbarium, Smithsonian Institution, Washington. Fosberg, Kanehira, Hosokawa.

Phytogeographical Summary

From the patterns of distribution the Cyperaceae in Micronesia can be divided into three major groups: Indo-Malaysia group, Pacific group, and Pantrropic group. The proportions are nearly equal at a ratio of 23 : 24 : 25. The Western Caroline Islands with 57 of 67 species are the richest in Cyperaceae.

The main part of the distribution range of the Indo-Malaysia group covers the eastern part of India, the Indo-Chinese peninsula and Malaysia. In Micronesia the range extends from the Philippines and western Malaysia northeastwards to the Western Carolines and the Marianas, and in some cases further east to the Eastern Carolines. Of a total of 23 species occurring in the Western Carolines 12 species extend into the Eastern Carolines whereas 10 species extend to the Marianas. Taxa: *Scirpodendron Ghaeri* (*), *Mapania pandanophylla* with its ssp. *immensa* (*), *Scleria levis*, *S. polycarpa* (*), *S. scrobiculata* (*), *S. sumatrensis*, *S. caricina* (*), *Scirpus juncoides* (*), *S. littoralis* ssp. *thermalis*, *Eleocharis ochrostachys* (*), *Eleocharis dulcis* (*), *Fimbristylis autumnalis* ssp. *tainanensis*, *F. globulosa* (*), *F. pauciflora*, *F. nutans*, *Cyperus tenuiculmis* (*), *C. pilosus*, *C. sulcinux*, *C. cyperinus* (*), *C. zollingerianus*, *Rhynchospora rubra*, *Carex indica*. (Species with * extend from the Western Carolines to the Eastern Carolines).

The Pacific group consists of those which are widely spread on the Pacific islands including Micronesia, Polynesia, New Guinea and New Zealand. Some species of this group occur also in Malaysia (particularly in the Philippines) and northeastern Australia like those of the Indo-Malaysian group but they never reach continental Asia. The species restricted to a certain small area in the Pacific Basin may be interpreted to have a much reduced range. Such local taxa show some peculiar distribution. Taxa: *Mapania macrocephala*, *Mapania parvibractea*, *Hypolytrum latifolium* ssp. *vitiense*, *Scleria novaehollandiae*, *Scleria rugosa*, *Fimbristylis tristachya*, *Fimbristylis cymosa*, *Cyperus javanicus*, *Machaerina falcata*, *Macherina mariscoides* including ssp. *colpodes*, *Schoenus punctatus*, *Schoenus calostachyus*, *Schoenus philippensis*. Endemics: *Mapania flavinux*, *Hypolytrum dissitiflorum*, *Fimbristylis palauensis*, *Schoenus tendo* ssp. *achaetus*, *Carex fuirenoidea*. Micronesia-Bonin link: *Fimbristylis dichotoma* ssp. *longispica*. Micronesia-Hawaii link: *Rhynchospora rugosa* ssp. *lavarum*, *Carex brunnea* ssp. *Meyenii*.

The pantrropic group consists mostly of tall-culmed Cyperi. Taxa: *Scleria lithosperma*, *Scirpus Fuirena*, *Eleocharis geniculata*, *Fimbristylis littoralis*, *Fimbristylis monostachyos*, *Fimbristylis dichotoma*, *Cyperus digitatus*, *C. distans*, *C. rotundus*, *C. Iria*, *C. compressus*, *C. difformis*, *C. haspan*, *C. polystachyos*, *C. cyperoides*, *C. brevifolius*, *C. Kyllingia*, *C. ferax*, *Rhynchospora corymbosa*.

Note: in the text, the term "practical description" refers to a previously published useful botanical description.

Acknowledgments

I appreciate the cooperation of the curators of the herbaria cited in the text for their permission of free use or the loan of specimens. My sincere thanks are also due to Miss M. C. Neal of the B. P. Bishop Museum, Dr. E. H. Walker, then botanist at the Smithsonian Institution, Prof. T. S. Liu of the National Taiwan University, and Dr. B. C. Stone of the College of Guam for their various personal help and kindness. A series of papers contributed by Dr. J. H. Kern on the Cyperaceae in Malaysia was often very suggestive in the course of this study.

A Key to Genera of Micronesian Cyperaceae

1. Pistillate flower terminal, always only one to a spikelet; achenes bony, the angles inconspicuous or very obtuse.
2. Spikelets bisexual with one terminal pistillate and more than 2 axillary staminate flowers. (Tribe MAPANIEAE).
 3. Leaf blades and bracts grass-like, i.e. dorsiventrally flattened.
 4. Pistillate flowers naked.
 5. Spikelets with 2 opposite prophylloid and several spirally arranged glumes. 1. *Scirpodendron*.
 5. Spikelets with 2 opposite prophylloid glumes only 3. *Hypolytrum*.
 4. Pistillate flowers subtended by 3 squamellae. 2. *Mapania*.
 3. Leaves of bladeless sheaths; blade of involucral bract culm-like; culms pseudo-septate. 4. *Lepironia*.
 2. Spikelets unisexual. (Tribe SCLERIEAE). 5. *Scleria*.
 1. Pistillate or fruit-bearing flowers axillary, 1 to several to a spikelet; achenes ligneous, usually conspicuously angled.
 6. Fruit-bearing flowers subtended by a glume only, usually hermaphrodite, rarely unisexual.
 7. Spikelets prophyllate, i.e. the lowest glume of spikelets dissimilar to the others, bicarinate; inflorescence an umbel or a head. (Tribe CYPEREAE). 9. *Cyperus*.
 7. Spikelets non-prophyllate, i.e. all glumes of spikelets similar.
 8. All glumes of a spikelet flower-bearing, the lower larger than the upper. (Tribe SCIRPEAE).
 9. Pistils not jointed between stylebase and ovary (achene). 6. *Scirpus*.
 9. Pistils jointed between thickened stylebase and ovary (achene).
 10. Perianth bristles present; culms always unisporate, clothed at base with a few bladeless sheaths only; involucral bract scale-like. 7. *Eleocharis*.
 10. Perianth bristles absent; leaves usually bladed; inflores-

- cences usually umbellate, rarely a solitary spikelet; involucral bracts leaf-like. 8. *Fimbristylis*.
8. Only a few glumes of a spikelet flower-bearing, the lower empty and smaller than the upper. (Tribe RHYNCHOSPOREAE).
11. Fruit-bearing flower(s) born above staminate flowers; in Micronesian plants blades laterally compressed, falcate. 10. *Machaerina*.
11. Fruit-bearing flower(s) born below staminate flowers; in Micronesian plants blades dorsiventrally flat.
12. Stigmas 3; floral scales 2-ranked. 11. *Schoenus*.
12. Stigmas 2; floral scales irregularly spirally imbricated rarely 2-ranked. 12. *Rhynchospora*.
6. Pistillate flowers enclosed in a bottle-like organ (perigynium); all flowers unisexual. (Tribe CARICEAE). 13. *Carex*.

Genus 1. SCIRPODENDRON Kurz

Only Micronesian species 1. *S. Ghaeri*.

1. Scirpodendron Ghaeri (Gaertn.) Merrill in Philip. Journ. Sci. (Bot.) 9: 268, 1914; Kanehira in Journ. Dept. Agr. Kyushu Univ. 4: 281, 1935; Ohwi in Journ. Jap. Bot. 18: 137, 1942; S.T. Blake in Proc. Roy. Soc. Queensl. 54: 73, 1943.

Chionanthus Ghaeri Gaertn., Fruct. 1: 189, t. 39, f. 6 a-e, 1781.

Scirpodendron costatum (Thwaites) Kurz in Journ. Asiat. Soc. Beng. 38 (2) : 85, 1869; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Kükenh. in Engl., Bot. Jahrb. 31: 458, 1902.

Coarse perennial. Culms central, rigid, smooth, 20–30 cm tall, 8–12 mm thick. Leaves many, basal and subbasal; blades coriaceous, flat, 3–6 cm wide, up to 100 cm long, serrulate-scabrous on margins; sheaths dark purplish brown. Spikes several, congested in terminal head-like cluster 6–12 cm long and 5–8 cm across; involucral bracts several, leaf-like, the longer more than 150 cm long. Glumes broadly ovate, 8 mm long, obtusish at apex, inconspicuously keeled. Achenes rhombic-obovoid, mostly hexagonal, 10–15 mm long, 6–8 mm wide, obtuse-angled and concave-faced, chestnut-brown at maturity. [Illustr.] C. B. Clarke, Illustr. Cyper. t. 114, f. 7–12, 1909.

WEST CAROLINES: YAP: without definite locality. *Volkens* 519 (B).—PALAU: Babelthaob Islet, Aimiriik. *Tuyama* s.n.! (TI); Babelthaob Islet, Gaspan. *Tuyama*, s.n.! (TI), *Okamoto*, s.n.! (TI).

EAST CAROLINES: PONAPE: without definite locality. *Kanehira* 1685, ex p.! (FU, TI), *Riesenbergs* 75! (BISH); Colonia, Banks of Tawensokola River. *Stone* 1817! (GUAM).—KUSAIE: Maalem village. *Hosokawa* 6331! (TAI).—Also Ceylon, Malaysia, Samoa and northern Australia.

Genus 2. MAPANIA Aublet

1. Culms central, leafy at base and usually few-leaved at the middle; achenes more than 3 mm long.
 2. Inflorescence a compound corymb with many elongate branches.
 3. Achenes 3-angled with 3-fid style, dark brown, broadest below the middle.
 4. Achenes 2.5–4 mm long; corymb rays not hispid.
 - 2. *M. pandanophylla* ssp. *pandanophylla*.
 4. Achenes 4.5–5 mm long; corymb rays hispid.
 - 2a. *M. pandanophylla* ssp. *immensa*.
 3. Achenes biconvex with 2-fid style, stramineous, broadest above the middle.
 - 3. *M. flavinux*.
 2. Inflorescence a head.
 - 4. *M. macrocephala*.
1. Culms lateral, scape-like, with a few bladeless sheaths only.
 - 5. *M. parvibractea*.
2. **Mapania pandanophylla** (F. v. Muell.) K. Schumann in K. Schum. & Hollr., Fl. Kais. Wilhelmsl. 25, 1889; K. Schumann & Lauterb., Fl. Deutsch. Schutzgeb. Südsee 189, 1900.

ssp. **pandanophylla**.

Hypolytrum pandanophyllum F. v. Muell., Fragm. Phytogr. Austral. 9: 16, 1875.

Thoracostachyum hypolytroides (F. v. Muell.) C. B. Clarke in Hook. f., Fl. Brit. Ind. 6: 681, 1894; Kükenth. in Engl. Bot. Jahrb. 59: 8, 1924.

Thoracostachyum pandanophyllum (F. v. Muell.) Domin in Bibliothec. Bot. Heft 85, 4: 484, 1915; Uittien in Rec. Trav. Bot. Néerl. 33: 183, 1936; Hosokawa in Trans. Nat. Hist. Soc. Formosa 28: 152, 1938.

More or less tufted from lignous rhizome; stolons as much as 50 cm long, clothed with brownish spathaceous scales. Leaves coriaceous, up to 2.5 m long, 5 cm wide, 3-costate, gradually acuminate at apex, serrulate-scabrous on margins. Culms up to 120 cm tall, smooth throughout, leafy below. Inflorescence paniculate-corymbose, 7–17 cm long, 7–10 cm wide; branches many, 2–4 cm long, smoothish; longer involucral leaves up to 120 cm long; spikes numerous but branches and branchlets are visible from outside, pale-brown, ovoid-globose at maturity, 7–8 mm long, 6–7 mm wide. Glumes broadly elliptic to semicircular, pale brown, 3–3.5 cm long, rounded at apex, 1-nerved. Prophylls lance-ovate, hyaline, ca. 3 mm long, spinulose on keel. Achenes ovoid-pyramidal, 3-angular, light purplish-brown and densely purple-maculate, 2.5–3.5 mm long including 1 mm long beak, broadest below the middle, cuneate at base; stigmas 3. Perigoniophylls 3, lanceolate, acutish, as long as prophylls. [Illustr.] C. B. Clarke, Illustr. Cyper. t. 108, f. 7–10, 1909.

MARIANAS: Rota Is., Sabana. Necker RS-6! (US).

WEST CAROLINES: PALAU: Babelthaob Islet. Ledermann 14399! (K).

Hosokawa 9689! (BISH, TAI).—Also India, Malaysia and northern Australia.

2a. ssp. **immensa** (Kükenth.) T. Koyama, stat. nov. (Pl. 3, fig. B)

Thoracostachyum hypolytroides C. B. Clarke var. *immensum* Kükenth. in Engl., Bot. Jahrb. 59: 8, 1924; Kanehira in Journ. Dept. Agr. Kyushu Univ. 4: 282, 1935; Ohwi in Journ. Jap. Bot. 18: 137, 1942.

Thoracostachyum pandanophyllum Domin var. *immensum* (Kükenth.) Hosokawa in Trans. Nat. Hist. Soc. Formosa 28: 152, 1938.

Thoracostachyum pacificum Hosokawa in Trans. Nat. Hist. Soc. Formosa 32: 6, 1942.

Achenes 4.5–5 mm long, 2.8–3.5 mm wide, almost conical with very short base, attenuate to thick beak immediately above the base; corymb rays and raylets hispid on angles; otherwise as in ssp. *pandanophylla*.

EAST CAROLINES: PONAPE: without definite locality. *Kanehira* 1673! (FU, TI), *Kanehira & Hatusima* 10770! (FU); Tolomail. *Takamatsu* 994! (BISH); Mt. Nan-a-raut, 500 m. *Hosokawa* 8199! (TAI), Mt. Nan-a-raut, in moss forest at the summit. *Hosokawa* 8222! (TAI—Type of *Th. pacificum*); Nipit, near One, 200 m. *Hosokawa* 5815! (BISH); Kuporujo. *Takamatsu* 668! (BISH); Laperei. *Ledermann* 13572! (B, K).—Endemic in East Caroline Islands.

Subspecies *immensa* differs from ssp. *pandanophylla* only by the slightly larger achenes and hispid corymb branches as described above. With the very short stipe and depressed base the achenes of ssp. *immensa* tend to be more pyramidal than in ssp. *pandanophylla* having ovoid achenes with more projected base. But some intermediate shapes of achenes have been seen in the specimens of ssp. *pandanophylla* from western Carolines. In spite of such minor morphological differences the two subspecies are clearly separated geographically as ssp. *immensa* is restricted to eastern Carolines while widespread ssp. *pandanophylla* occurs in western Carolines.

3. **Mapania flavinux** T. Koyama, sp. nov. in sectione *Thoracostachyo*, differt a *M. bancana* achaenio flavo non fusco multo majore et a *M. floribunda* spiculis paucius florentibus et achaenii forma.

Laxiuscule caespitosa rhizomate lignoso. Folia ad basin culmi aggregata, et superiora 2 vel 3 caulina, laminis elongatis usque ad 120 cm longis 3 cm latis planis laete viridibus ad margines costamque valde serrulatoscabris, apice gradatim acuminata. Culmus centralis acute triquetus omnino laevis ad 1 m altus. Inflorescentia paniculato-corymbosa ovoideo-globosa 5–11 cm longa 3–8 cm lata composita perdense multispicata sed ramis ramulisque visibilibus; folia involucri ad 70 cm longa. Spicae ovoideo-globosae maturitate 5–8 mm longae ac latae. Glumae obovatae 1.8–2 mm longae flavescentes vel pallidae apice rotundae, costa subtrinervia. Prophylla lanceolata 2 mm longa apice obtusiuscula ad costam minute scabriuscula. Perigoniiphylla 3 cum prophyllo subaequantia lanceolata plus minus inaequalia. Achaenia obovata turgido-biconvexa 3–3.5 mm longa circ. 2.5 mm lata facie straminea et paulo rugosa basi cuneata apice contracta

et rostrum erectum 1.2–1.5 mm longum sensim producta; styli rami 2.

WEST CAROLINES: PALAU: Babelthaob Islet, Gaspan. *Tuyama s.n.!* (Holotype in TI).—Endemic in the West Carolines.

Although this newly proposed taxon is known only by the type collection it is easily recognized by the digynous, yellowish achenes only weakly longitudinally rugose on the upper half of each side. A spikelet consists of 5 squamellae, of which the three are perianth segments of the fruit-bearing flower by their apparent position. The so-called front squamella is missing. The lateral squamellae, which are in my opinion prophylls of the spikelet, are beautifully ciliate with dark brown short hairs as often seen in *Paramapania*.

4. *Mapania macrocephala* (Gaudich.) K. Schumann ex Warburg in Engl., Bot. Jahrb. 13: 265, 1891; K. Schumann & Lauterb., Fl. Deutsch. Schutzgeb. Südsee 189, 1900; Hosokawa in Trans. Nat. Hist. Soc. Formosa 28: 152, 1938; S. T. Blake in Journ. Arn. Arb. 28: 212, 1947.

Hypolytrum macrocephalum Gaudich. in Freyc., Voy. Bot. 414, 1826.

Mapania palauensis Hosokawa in Trans. Nat. Hist. Soc. Formosa 32: 7, 1942. Syn. nov. e typo! (Pl. 1, fig. B).

Mapania yapensis Hosokawa in Trans. Nat. Hist. Soc. Formosa 32: 8, 1942. Syn. nov. e typo! (Pl. 1, fig. A).

[Practical description] Hosokawa in Trans. Nat. Hist. Soc. Formosa 32: 7, 1942, under *Mapania palauensis*. [Illustrr.] Pl. 1 and Pl. 3, fig. G of the text.

WEST CAROLINES: YAP: Mt. Daboi. *Hosokawa* 8748! (TAI—type of *M. yapensis*).—PALAU: Babelthaob Islet, Mt. Sul. *Hosokawa* 9817! (TAI—type of *M. palauensis*) ; Gaspan. *Tuyama s.n.!* (TI).—Also Malaysia and Polynesia.

In 1959, guided by Prof. T. S. Liu, I have examined the type specimens of *M. palauensis* Hosokawa and *M. yapensis* Hosokawa at Taipei and found them quite identical with *M. macrocephala*, a well known species of the section *Cephaloscirpus*. From Hosokawa's notes his bases for creating the new taxa seem to be the more or less lobed head of *M. palauensis* and the slightly shorter achenes of *M. yapensis*. I have seen some 14 specimens of *M. macrocephala* from the other regions for comparison. Heads are more commonly slightly lobed, and the achenes ranges from 4.5 to 7 mm in length. Micronesian specimens are, therefore, completely included in the variation range of *M. macrocephala*.

5. *Mapania parvibractea* (C. B. Clarke) T. Koyama, comb. nov.

Hypolytrum parvibractea C. B. Clarke in Kew Bull. 1899: 114, 1899.

Mapania montana K. Schumann & Lauterb., Fl. Deutsch. Schutzgeb. Südsee 189, 1900.

Thoracostachyum lucbanense (Elmer) Kükenth. ex Merrill in Philip. Journ. Sci. (Bot.) 11: 258, 1916; Kükenth. in Engl., Bot. Jahrb. 59: 9, 1924.

Paramapania parvibractea (C. B. Clarke) Uittien in Rec. Trav. Bot. Néerl. 33: 143, 1936; S. T. Blake in Journ. Arn. Arb. 28: 209, 1949; Kern

in *Blumea* 9: 217, 1958.

Rhizome ligneous, clothed with dark brown fibrous remnants of basal sheaths. Leaves many, tufted; blades elongate, as much as 80 cm long, 12 mm wide, flat above, plicate below, thinly coriaceous to herbaceous, light green, unicostate, gradually cuspidate at apex; sheaths light reddish-brown, persistent and disintegrating into fuscous fibers. Culms lateral, subscapose, clothed at base with a few brownish bladeless sheaths, usually 1-vaginate at the middle. Inflorescence a terminal corymb, simple to compound, hemisphaerical, 2.5–5 cm long, 4–7 cm wide; bracts spathaceous or scale-like, brownish, 1 cm long; branches smooth, up to 3 cm long. Spikes many, ovoid-globose, 3–6 mm long, 4–5 mm across at maturity, dark reddish-brown. Glumes elliptical, round-tipped, 1–1.5 mm long, castaneous, obscurely 1-nerved; prophylls narrowly lanceolate, as long as the glume, castaneous, prominently hispid-ciliate on keel. Achenes ovoid or more or less rhombic-ovoid, almost not angular, 1.8–2.2 mm long, about 1 mm across, cuneate at apex, yellow-brown to light brown, densely spotted with dark red-brown; beak very short; style branches mostly 3, sometimes 2, both intermixed on the same corymb. [Illustr.] Pl. 3, fig. C of text.

WEST CAROLINES: PALAU: Babelthaob Islet, Nagtkip. *Ledermann* 14559! (B, K).—Also throughout Malaysia and Fiji.

Recorded from Micronesia only by a single collection, of which I have seen a fragment through the courtesy of the late Mr. E. Nelmes of the Kew Gardens. Ledermann's collection has immature achenes only, but the very short beak of achenes is sufficient to distinguish it from very similar *M. radicans*. As to the identity of *Paramapania lucbanensis* I follow Kern (1958). The above description is based upon a series of New Guinean specimens deposited in the New York Botanical Garden.

When the genus *Mapania* of my concept is further divided into smaller genera as is done by some current cyperologists, *M. parvibractea* belongs to the genus *Paramapania* and *M. pandanophylla* and *M. parvinux* are included in the genus *Thoracostachyum*, while *M. macrocephala* will remain as a sole Micronesian member of the genus *Mapania s. str.* The delimitation and morphological interpretation of such genera are different person by person, and I sometimes found intermediates between any two genera. As was remarked in my previous paper (T. Koyama, 1959) I am not convinced of the validity of such genera when they are treated on a world basis.

Genus 3. HYPOLYTRUM L. C. Richard

1. Inflorescence hemisphaerical, dense, erect; spikelets 5–8 mm long, hemispherical-globose; achenes elliptic, contracted at mucronate apex. 6. *H. nemorum* ssp. *vitiense*.
1. Inflorescence oblong-elliptic, rather loose, more or less nodding; spikelets 7–12 mm long, elliptic; achenes ovoid, gradually narrowed to long-beaked apex. 7. *H. dissitiflorum*.

6. *Hypolytrum nemorum* (Vahl) Sprengel, Syst. 1: 233, 1825.

ssp. *vitiense* (C. B. Clarke) T. Koyama, stat. nov. (Pl. 3, fig. E)

Hypolytrum vitiense C. B. Clarke in Kew Bull. Add. Ser. 8, 51, 1908.

'*Hypolytrum latifolium* (non L. C. Rich.)': Volkens in Engl., Bot. Jahrb. 31: 457, 1902; Kükenth. in Engl., Bot. Jahrb. 59: 7, 1925; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 279, 1935; Ohwi in Journ. Jap. Bot. 18: 137, 1942; Hosokawa in Trans. Nat. Hist. Soc. Formosa 32: 5, 1942.

Culms from ligneous rhizome, 30–80 cm tall, clothed at base with a few cinnamon cataphylls, smooth except on inflorescence axis. Leaves basal and 1 or 2 upper on the culm; blades flat, herbaceous, whitish-green, 1–2.8 cm wide, 3-costate, overtopping the inflorescence, gradually acuminate at apex. Inflorescence a hemisphaerical corymb, 4–6 cm long, 9–11 cm across, compound; rays up to 4 cm long, hispid-scabrous on angles; involucral leaves about 2, the longer 20 cm long or more. Spikes globose at maturity, 5–8 mm long and as wide, ferruginous, many-flowered. Glumes oval, 2 mm long, membranous, light brown, indistinctly 1-nerved, mucronate at apex. Prophylls linear-lanceolate, hispid on keel, half as long as the mature achene. Achenes elliptic, biconvex, 3.8–4 mm long, 1.8–2 mm wide, contracted at both ends, light pale-brownish and maculate with reddish lineolae, very weakly rugose; style branches 2.

MARIANAS: without definite locality. Fritz (not seen, cited by Kükenthal l.c.).

WEST CAROLINES: YAP: without definite locality. Volkens 259 (B), Kanehira 1140! (FU), Momosé s. n.! (TI); Kolonie, Monte Kabul. Tuyama s.n.! (TI); Mt. Dabiol. Hosokawa 8748-a! (TAI); near Tarago. Hosokawa 8722! (TAI); between Molokai and Galakai. Tuyama s.n.! (TI).—PALAU: Babelthaob Islet. Hosokawa 9645! (TAI) [immature specimen]; Aimiriik. Kanehira & Hatusima 4582 & 4597! (FU), Okamoto 22! (FU); Gardok. Hatusima 5006! (FU).—Fiji Islands.

In Micronesia this plant has long passed under the name of *H. latifolium*, which is now a synonym of *H. nemorum* of earlier date. The identity between the two was proved by Kern (1958), who examined the type of *H. nemorum* at Copenhagen.

The Micronesian specimens examined by me do not perfectly agree with *H. nemorum* of the Indo-Malaysia in the red-spotted, paler achenes that are only indistinctly rugose and larger but are identical with those of *H. vitiense* of Fiji with "nive levi, rubromaculata" (C. B. Clarke's original description). In the Indian subcontinent the achenes of *H. nemorum* are invariably strongly rugose and rust-brown and scarcely exceed 3 mm in length. But in Malaysia *H. nemorum* shows a considerable variation particularly in achene characters: the achene length ranges from 1.8 mm to 3.75 mm; the shape varies from orbicular-ovate through ovate to elliptic; and even hardly rugose achenes are not rare. Several sheets of *H. vitiense* from Fiji were also examined at the New York Botanical

Garden. Their achenes are always very indistinctly rugose and longer than 3.5 mm, but the color is not constantly as pale as in Micronesian specimens. By these morphological reasons *H. vitiense* is here reinterpreted as a subspecies of the widespread *H. nemorum*.

7. Hypolytrum dissitiflorum Steudel, Syn. Pl. Glumac. 2, 132, 1855; Kükenth. in Engl., Bot. Jahrb. 59: 7, 1925; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 279, 1935; Ohwi in Journ. Jap. Bot. 18: 137, 1942.

Hypolytrum oligostachyum K. Schumann & Lauterb., Fl. Deutsch. Schützgeb. Südsee 190, 1901.

Hypolytrum dissitiflorum Steud. var. *oligostachyum* (K. Schum. & Lauterb.) Kükenth. in Engl., Bot. Jahrb. 59: 8, 1925.

Culms tufted in small clumps from short rhizome, 50–90 cm tall, as much as 4 mm thick below, smooth except at very apex, 2- or 3-noded. Leaves basal and the upper 2 or 3 on the culm; blades flat, 8–20 mm wide, soft, herbaceous, overtopping the culm, light green, paler beneath, 3-costate, plicate; basal sheaths bladeless, stramineous-brownish or cinnamon. Inflorescence paniculate-corymbose, overtopping, up to 13 cm long, 6 cm wide, oblong, loose with slender branches; branches paired or in threes, as much as 8 cm long, (3-) 4- to 8-spiked; involucral leaves 1 or 2, the longer twice as long as the inflorescence. Spikes ovoid-globose, 7–12 mm long, 6–7 mm across, peduncled, brownish. Glumes, the lower few sterile, lanceolate, acuminate, the fertile ones obovate, 3–3.5 mm long, 1.5–1.8 mm wide, membranous, yellow-brown, the margins yellow, hyaline, the midvein distinct. Prophylls linear-lanceolate, hyaline, densely hispid on keel, 3–3.5 mm long. Stamens 2. Achenes ovate, biconvex, 3.8–4 mm long including 1.5 mm long beak, 1.5–1.7 mm wide, roughly longitudinally rugose, deep yellow-brown at maturity, cuneate at base, abruptly contracted above to short-beaked apex; style branches 2. [Illustr.] Pl. 3, fig. F of text.

Genus 4. LEPIRONIA L. C. Richard

Only Micronesian species. 8. *L. articulata*.

8. Lepironia articulata (Retz.) Domin in Bibliothec. Bot. 20, Heft. 85: 486, 1915; S. T. Blake in Proc. Roy. Soc. Queensl. 54: 71, 1943.

Restio articulata Retzius, Obs. Bot. Pt. 4, 14, 1786.

Lepironia mucronata L. C. Richard in Pers., Syn. Pl. 1: 70, 1805; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Kükenth. in Engl., Bot. Jahrb. 59: 9, 1924.

[Practical descr.] Chermezon in Fl. Madagascar, 39^e fam., Cypérac. 244, 1937, under *L. mucronata*. [Illustr.] C. B. Clarke, Illustr. Cyp. t. 118 f. 8–16, 1909; Chermezon, l.c. 241, f. 23: 5–8, 1937. Both under *L. mucronata*.

WEST CAROLINES: YAP: without definite locality. Volkens 498 (B, not seen, citation based on Kükenth. l.c.); Tomil Islet. Tuyama s.n.! (TI).—Also Australia and southern Africa.

An aphyllous sedge recognizable at once by its septate, terete culms. Being a native of southern Hemisphere it is widely cultivated in southern China, Formosa, and perhaps in Malaysia for making a kind of rough mat well known as 'ampera'. The Micronesian plant seems to be of some cultivated origin related to sugar farms.

Genus 5. SCLERIA Bergius.

1. Perennial with ligneous rhizomes; plants usually coarse; partial panicles born on the upper part of culms only.
 2. Spikelets bisexual; inflorescence a terminal spike; achenes without any hypogynium. (Sect. HYPOPORUM). 9. *Scl. lithosperma*.
 2. Spikelets unisexual; inflorescence a panicle; achenes subtended by a hypogynium here termed as a disc. (Sect. SCLERIA).
 3. Leaves evenly distributed; lateral partial panicles usually absent or much smaller than the terminal one. 10. *Scl. levis*.
 3. Leaves, at least middle ones, pseudo-whorled, i.e. subverticillately clustered in group of 2 to 5.
 4. Hypogynium disc-like, the lobed not more than half the length of achene body.
 5. Contraligules 2 to 3 times as long as wide; bracteoles longer than very dense partial panicles, thus panicles slightly bearded. 11. *Scl. ciliaris*.
 5. Contraligules shorter than wide; bracteoles shorter than normally grown sidebranches.
 6. Achenes smooth; disc-lobes acute and toothed at apex. 12. *Scl. polycarpa*.
 6. Achenes distinctly tessellate; disc-lobes round at apex. 13. *Scl. scrobiculata*.
 4. Hypogynium cup-like, covering the lower 2/3 of the achene body. 14. *Scl. sumatrensis*.
 1. Annual with fibrous roots only; plants usually slender and small; partial inflorescences distributed on the whole length of culms.

7. Spikelets paniculate; achenes falling off apart from the surrounding scales. (Sect. TESSELLATAE).
8. Plant glabrous; achenes ellipsoid-ovoid, 1.5 mm across or more, obscurely tessellate above the middle. 15. *Scl. novae-hollandiae*.
8. Plant usually more or less pubescent; achenes globular, 1–1.3 mm across, distinctly scrobiculate. 16. *Scl. rugosa*.
7. Spikelets congested in small heads at leaf axils; achenes falling off tightly inclosed in two surrounding scales. 17. *Scl. caricina*.
9. ***Scleria lithosperma*** (Linn.) Swartz, Prodr. Veg. Ind. Occid. 18, 1788; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Kükenth. in Engl., Bot. Jahrb. 59: 9, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 282, 1935; Ohwi in Journ. Jap. Bot. 18: 138, 1942.

Scirpus lithospermus Linn., Sp. Pl. ed. 1, 51, 1753.

13. Scleria scrobiculata Nees & Meyen ex Nees in Wight, Contrib. Bot. Ind. 117, 1834.

'*Scleria multifoliata* (non Böcklr.)': Kükenth. in Engl., Bot. Jahrb. 59:

10, 1925; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 282, 1935; Ohwi in Journ. Jap. Bot. 18: 138, 1942.

[Practical descr.] Kern in Blumea 11: 185, 1961. [Illustr.] C. B. Clarke, Illustr. Cyper. t. 129 f. 3, 1909 (under *Scl. multifoliata*, achene); Kern, l.c. f. 6b on p. 181 (achene).

WEST CAROLINES: PALAU: Korror Islet. *Kanehira* & *Okuya* s.n. (FU), *Kanehira* 118! (FU), *Kanehira* & *Hatusima* 4417! (FU); Korror, Almijt. *Tuyama* s.n.! (TI).—

EAST CAROLINES: PONAPE: Laperei, 100 m. *Ledermann* 13604 (B).—Also India, southern China, Malaysia and northern Australia.

This plant has been recorded from Micronesia under the name of *Scl. multifoliata*, which is according to Kern (1916) synonymous with *Scl. purpurascens*. The two species are very similar, but can be separated by achene characters when collected in fruit: achenes of *Scl. scrobiculata* are creamy-white and truly scrobiculate, whereas in *Scl. purpurascens* they turn purplish-brown when mature and are only indistinctly cancellated.

14. *Scleria sumatrensis* Retzius, Observ. Bot. 5, 19, t. 2, 1789; Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 264, 1935.

19. **Scirpus juncoides** Roxb. [Hort. Beng. 81, 1814, nomen] Fl. Ind. ed. 1, 1: 228, 1820; Ohwi in Journ. Jap. Bot. 18: 135, 1942.
- '*Scirpus erectus* (non Poir.)': Merrill in Philip. Journ. Sci. (Bot.) 9: 63, 1914; Kükenth. in Engl., Bot. Jahrb. 59: 9, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 281, 1935.
- Tufted annual with fibrous roots only. Culms slenderly terete, 20–60 cm tall, 1–3 mm thick, light green, weakly angular when dry, clothed at base with a few bladeless sheaths 3–10 cm long. Inflorescence a pseudo-lateral head of 2 to 7 spikelets; involucre culm-like, erect, up to 7 cm long, 1-furrowed toward base. Spikelets ovoid or ovoid-ellipsoid, stramineous-greenish, 6–13 mm long, 3–4 mm across, obtusish at apex, densely many-flowered. Glumes broadly elliptical, 3.5–4 mm long, thickly membranous, boat-shaped, rounded and mucronulate at apex, pale-brownish on both sides, keel broad, green. Achenes obovate-orbicular, unequally biconvex, 1.8–2.1 mm long, 1.5–1.7 mm wide, rounded and mucronate at apex, abruptly contracted at base, the sides very weakly pitted, brown-black and slightly shiny at maturity; style branches 2, sometimes with rudimentary

third one; perianth bristles 6, the longer exceeding the achene. [Illustr.] T. Koyama in Journ. Fac. Sci. Univ. Tokyo III, 7: 313, f. 9-a, 1958 (Achene).

MARIANAS: GUAM: Guam Exp. Station Herb. 215! (BISH, NY, US), Thompson 215! (BISH).

WEST CAROLINES: PALAU: Aimion, Katelwell. Tuyama s.n.! (TI); Babelthaob Islet, Galdok. Hatusima 5079! (FU).—Also India, Indo-China, southern China, Japan, Malaysia and Australia.

20. *Scirpus littoralis* Schrader, Fl. Germ. 1: 142, 1806.

ssp. *thermalis* (Trabut) T. Koyama, stat. nov.

Scirpus littoralis Schrader var. *thermalis* Trabut in Battand. & Trabut, Fl. Algér. (Monocot.) 99, 1899.

'*Scirpus subulatus* (non Vahl)': Ohwi in Journ. Jap. Bot. 18: 135, 1942.

'*Scirpus littoralis* (non Schrad.)': Kükenth. in Engl., Bot. Jahrb. 59: 6, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 281, 1935.

Culms closely standing in a row along horizontal rhizome, terete or very obscurely trigonous toward the apex, glaucous, 60–120 cm tall, 5–8 mm thick below the middle, clothed at base with a few gray-brown sheaths only. Inflorescence a pseudo-lateral corymb with 3 to 7 unequal rays up to 5 cm long; involucre culm-like, subcompressed, erect, as long as the corymb. Spikelets clustered in 2 or 3, sometimes solitary, ovate-oblong, 7–12 mm long, 3–4 mm across, rust-brown, more or less acute at apex. Glumes oblong-ovate, membranous, rust-brown, pale on margins, keel slender, ending in a short mucro at contracted apex. Achenes broadly obovate, lenticular, 2 mm long, 1.5 mm wide, brown and smooth, rounded and mucronate at apex; style branches 2; perianth bristles 4, plumose with rusty-brown ciliae, slightly longer than achene. [Illustr.] T. Koyama in Can. Journ. Bot. 41: pl. III f. 6, D, 1963 (Achenes).

MARIANAS: GUAM: near mouth of Sasa River, tidal flats and adjacent coastal forest. Stone 4150! (DAO, GUAM).—SAIPAN: Kanehira & Hatusima 4298! (FU), Hatusima 10658! (FU), Momosé s.n.! (TI); near Potamcho. Hosokawa 9636! (TAI); 'Sumpf.' Höfer 34 (B).—TINIAN: Churo Pond. Hosokawa 7777! (TAI).—Also Africa, Malaysia, coastal Australia and New Caledonia.

Subspecies *thermalis* is a terete-culmed maritime race of *S. littoralis*, and differs from the terete-culmed inland race, ssp. *subulatus*, by thicker, obtuse-tipped glumes and far more luxuriant corymbs. In southeastern Asia and Australia the two subspecies are sometimes connected with various intermediate forms, while in western India and Asia Minor ssp. *subulatus* approaches ssp. *littoralis*.

Genus 7. ELEOCHARIS R. Brown

1. Spike cylindrical, nearly as wide as culm; culms thick, 3–5 mm across. (Sect. LIMNOCHLOA).
 2. Culms solid, not septate. 21. *E. ochrostachys*.

2. Culms empty, transversely septate. 22. *E. dulcis*.
 1. Spike ellipsoid or ovoid, much wider than culm; culms slender, usually less than 3 mm thick (Sect. ELEOCHARIS).
 3. Stolons present; culms hair-like, 0.1–0.2 mm thick; spikes loosely few-flowered. 23. *E. acicularis*.
 3. Stolon absent; culms slenderly terete, 0.6–2 mm thick; spikes densely many-flowered.
 4. Achenes olivaceous; style branches 3; spike ovoid to oblong-lanceolate. 24. *E. congesta* ssp. *subvivipara*.
 4. Achenes blackish; style branches 2; spikes ovoid-globose. 25. *E. geniculata*.

21. **Eleocharis ochrostachys** Steudel, Syn. Pl. Glum. 2, 80, 1855; Ohwi in Journ. Jap. Bot. 18: 132, 1942.

Eleocharis variegata Presl. var. *laxiflora* (Thwaites) C. B. Clarke in Hook. f., Fl. Brit. Ind. 6: 601, 1893; Kükenth. in Engl., Bot. Jahrb. 59: 4, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 277, 1935.
'Eleocharis fistulosa' (non Link)': Volkens in Engl., Bot. Jahrb. 31: 458, 1902.

[Practical descr.] Ohwi in Mem. Coll. Sci. Kyoto Univ. B, 18: 32, 1944; Svenson in Rhodora 31: 156, 1929, under *E. variegata* var. *laxiflora*. [Illustr.] Svenson, l.c. t. 188 f. 10 (achene).

MARIANAS: GUAM: 1 mile south of Piti village. Moore 184! (US).

WEST CAROLINES: YAP: without definite locality. Kanehira 1152! (BISH, FU, TI); District of Machabal, in Wasserlöcher der Pandanus-formation. Volkens 151 (B, not seen, citation based on Kükenth. l.c.).—PALAU: Arekalong. Takanamatsu 1663! (BISH); Babelthaob Islet, Molegojok. Tuyama s.n.! (TI); ditto, Aimiriik. Hosokawa 7289! (TAI), Kanehira & Hatusima 4545! (FU); Almonogui. Kanehira & Hatusima 4697! (FU); Babelthuap, Aimiriik, Stone 1333! (GUAM).

EAST CAROLINES: PONAPE: without definite locality. Kawagoë s.n.! (KAG), Ledermann 13657 (B); Kolonie. Kanehira 679! (FU, TAI) & 1515! (FU, US), Hatusima 11037! (FU); George village. Hosokawa 5866! (TAI); Nan-a-raut. Takamatsu 1085! (BISH), Hosokawa 5963! (BISH, TAI); Kamal. Hosokawa 6105! (BISH).—TRUK: Fefan Islet. Hosokawa 8394! (TAI).—Also India, Formosa, Ryukyus and Malaysia.

C. B. Clarke is of the opinion that *E. ochrostachys* of southeastern Asia is conspecific with *E. variegata* of Madagascar, no authentic material of which is at my disposal. I have carefully compared several selected sheets of *E. ochrostachys* with Chermeson's descriptions of *E. variegata*, and had a strong impression that the two might possibly be identical.

22. **Eleocharis dulcis** (Burm. f.) Trinii ex Henschel, Vita Rumph. 186, 1833; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 277, 1935; Ohwi in Journ. Jap. Bot. 18: 133, 1942; Walker & Rodin in Contrib. U.S. Nat. Herb.

30: 456, 1949.

Eleocharis plantaginoidea W. F. Wight ex Safford in Contrib. U.S. Nat. Herb. 9: 267, 1905; Merrill in Philip. Journ. Sci. 9: 60, 1914; Kükenth. in Engl., Bot. Jahrb. 59: 4, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 277, 1935.

[Practical descr.] S. T. Blake in Proc. Roy. Soc. Queensl. 50: 103, 1939; Ohwi in Mem. Coll. Sci. Kyoto Univ. B, 18: 32, 1944. [Illustr.] C. B. Clarke, Illustr. Cyper. t. 33 f. 1-5, 1909, under *E. plantaginea*; Svenson in Rhodora 41: t. 537 f. 6, 1939; S. T. Blake, l.c. t. 7 f. 6-9.

MARIANAS: GUAM: without definite locality. *McGregor* 469! (BISH, US); north of Talofofo River, in highland swamp. *Rodin* 689! (US).

WEST CAROLINES: PALAU: Gokkep. *Takamatsu* 1188! (BISH); Mari-kyoku. *Kanehira* 444! (FU); Babelthaob. *Hosokawa* 7385! (TAI); ditto, Ngara-dok. *Tuyama* s.n.! (TI); Korror Islet, Ngarabaket. *Tuyama* s.n.! (TI); ditto, im Tarofelde. *Raymundus* 147 (B).

EAST CAROLINES: PONAPE: without definite locality. *Kawagoë* s.n.! (KAG).—Also Japan, Ryukyus, Formosa, southern China, India, Malaysia and Australia.

E. dulcis is more commonly known as *E. plantaginea*. The Chinese water chestnut is a tuber of its cultivar. *tuberosa* having taller and thicker culms, and larger tubers as much as 5 cm in diameter.

23. *Eleocharis acicularis* (Linn.) Römer & Schult., Syst. Veg. 2: 154, 1817; Volkens in Engl., Bot. Jahrb. 31: 458, 1902.

Scirpus acicularis Linn., Sp. Pl. ed. 1, 48, 1753.

[Practical descr.] Ohwi in Mem. Coll. Sci. Kyoto Univ. B, 18: 35, 1944; Fernald, Gray's Man. Bot. ed. 8, 253, 1950. [Illustr.] Fernald, l.c. f. 379.

WEST CAROLINE: YAP: zwischen Moos am Grunde der Cocospalmen gemein. Volkens 254 (B, not seen, citation based on Volkens l.c.).—PALAU: Aimiriik. *Watanabe* s.n.! (ex p.) (TI).—Distribution circumboreal.

Watanabe's collection of this tiny spike-rush was mixed with *Fimbristylis littoralis*, and is supposed to have grown in rice paddy. It has elongate perianth bristles, hence the Micronesian plant can be referable to var. *longiseta* Svenson.

24. *Eleocharis congesta* D. Don, Prodr. Fl. Nepal. 41, 1825.

ssp. ***subvivipara*** (Böckeler) T. Koyama, stat. nov.

Eleocharis subvivipara Böckeler in Linnaea 36: 424, 1870.

Culms tufted from fibrous roots only, capillary to filiform, 5-20 cm tall, clothed at base with a few bladeless sheaths often more or less reddish. Spike lanceolate or lance-oblong, 7-17 mm long, 1.5-2.5 mm wide, reddish-brown, rather loosely many-flowered, frequently viviparous. Glumes oblong to elliptical, pale and tinged with reddish-brown, 1.5-2.5 mm long, obtuse at apex. Achenes obovate, 3-angled, 1-1.3 mm long, light tawny or yellowish; stylebase deltoid-ovate; style branches 3. Perianth bristles 6, exceeding achene. [Illustr.] C. B.

Clarke, Illustr. Cyper. t. 37 f. 13–16, 1909, under *E. subvivipara*.

WEST CAROLINES: PALAU: Mt. Luise-Almonogui. *Hosokawa* 6856! (BISH, TAI).—India, China, Japan and possibly in Malaysia.

Upon examination of a good set of *E. congesta* from northern India I am quite sure that *E. subvivipara*, *E. pellucida* (= *E. afflata* & *E. japonica*), *E. thermalis*, and a few of their close allies are conspecific. Subspecies *subvivipara* differs from ssp. *congesta* by generally more slender culms and oblong spikes that are frequently viviparous. For the detailed synonymy and discussion see T. Koyama (1961).

25. *Eleocharis geniculata* (Linn.) Römer & Schult., Syst. Veg. 2: 150, 1817.

Eleocharis capitata R. Brown, Prodr. Fl. Nov. Holl. 1, 225, 1810; Safford in Contrib. U.S. Nat. Herb. 9: 267, 1905; Merrill in Philip. Journ. Sci. (Bot.) 9: 60, 1914.

Eleocharis caribaea (Rottb.) S. F. Blake in Rhodora 20: 24, 1918; Ohwi in Journ. Jap. Bot. 18: 132, 1942.

[Practical descr.] Svenson in Rhodora 41: 50, 1939; S. T. Blake in Proc. Roy. Soc. Queensl. 50: 124, 1939; Ohwi in Mem. Coll. Sci. Kyoto Univ. B, 18: 44, 1944, under *E. caribaea*. [Illustr.] S. T. Blake, l.c. t. 10 f. 29–31.

MARIANAS: SAIPAN: *Hatusima* 10663! (FU).—GUAM: without definite locality. *McGregor* 393! (BISH, US), *Nelson* 307! (BISH), *Guam Exp. Station Herb.* 74 & 102! (BISH, US); near Pitti village. *Moore* 126! (US); Ylig-Siguia ridge. *Rodin* 665! (US); between Ylig and Talofofo river, 300–400 ft. *Steere* 65! (US); under Ylig river, Manengon savanna hills. *Stone* 3868! (DAO); highland swamp above Talofofo river. *Rodin* 693! (US); mouth of Ylig river. *Rodin* 766! (US); Atangtano. *Bryan Jr.* 1063! (BISH); SRF Road, Apra Harbor, edge of mangrove formation. *Stone* 4888! (GUAM).

MARSHALLS: Arno Atoll, Ulien Islet. *Hatheway* 806! (US); *B.C. Stone* 1090! (BISH); Ailuk Atoll, Ailuk Islet. *Fosberg* 33969! (BISH, US).—Widespread in tropical and subtropical regions of the World.

For nomenclatural discussion see T. Koyama (1961).

Uncertain Species

Eleocharis atropurpurea Kunth: Kükenth. in Engl., Bot. Jahrb. 59: 4, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 277, 1935. GUAM. *McGregor* 102 (ex Kükenth.).

This species was not found in the Micronesian collections that I examined nor was seen *McGregor* 102 on which Kükenthal's citation was based. If this *McGregor* number is the same as the Guam Experiment Station Herb. no. 102, it is *E. geniculata*. On the other hand it is possible that this tiny cosmopolitan plant occurs in Micronesia. Kanehira's citation is apparently based on Kükenthal.

Genus 8. FIMBRISTYLIS Vahl

1. Spikelets more than 2, disposed in umbels or heads.
2. Leaves at culm-bases all bladed.
 3. Leaf sheaths bilaterally compressed with acute keel, more or less 2-ranked; floral scales sharply keeled thus spikelets angular; styles not compressed nor fimbriate; style-branches definitely 3.
..... 26. *F. autumnalis* ssp. *tainanensis*.
 3. Leaf sheaths dorsiventrally compressed or with obtuse back, in most cases 3-ranked; floral scales with obtuse back thus spikelets terete; styles more or less compressed sometimes fimbriate above; style-branches 2 or 3.
 4. Ligule wanting; achenes dark-colored at maturity; style-branches 2 or 3.
 5. Style-branches 3; spikelets congested in globose head, the glumes tending to be slightly grayish.
..... 27. *F. cymosa* ssp. *umbellato-capitata*.
 5. Style-branches 2; spikelets solitary or in cluster of 2 or 3, the glumes tending to be ferruginous.
..... 27b. *F. cymosa* ssp. *spathacea*.
 4. Ligule a tuft of short hairs; achenes light brownish to creamy; style-branches definitely 2.
 6. Glumes with several parallel veins on back; achenes smooth.
 7. Spikelets oblong-cylindrical, less than 2.5 mm across; achenes brown at maturity. 28. *F. palauensis*.
 7. Spikelets ovoid, 5–6 mm across; achenes whitish-creamy at maturity. 29. *F. tristachya*.
 6. Glumes with a distinct keel otherwise nearly veinless; achenes trabeculate.
 8. Spikelets ovoid, less than 7 mm long, the glumes more or less castaneous-tinged, rarely pale-brown; anthers about 0.7 mm long.
 9. Achenes distinctly trabeculate with 5 to 12 rows of transversely oblong external cells; gynophore stipe-like, more or less inconspicuous.
..... 30. *F. dichotoma* ssp. *dichotoma*.
 9. Achenes weakly trabeculate with 12 to 20 rows of rectangular external cells as if multistriate under low-power lens; gynophore distinct.
..... 30b. *F. dichotoma* ssp. *podocarpa*.
 8. Spikelets oblong or oblong-ovoid, 7–15 mm long, the glumes tending to be rusty-brown; anthers more than 1 mm long.

10. Spikelets few, solitary or grouped; inflorescence more or less pseudo-lateral with straightish lowest involucral bract. 30c. *F. dichotoma* ssp. *longispica*.
10. Spikelets many, congested in hemispherical heads; inflorescence really terminal with spreading involucral bracts. 30d. *F. dichotoma* ssp. *boninensis*.
2. All or some leaves at culm bases bladeless.
11. Some leaves with laterally compressed blade; involucre exceeding inflorescence. 31. *F. littoralis*.
11. All leaves bladeless; involucre shorter than inflorescence.
- 32. *F. globulosa*.
1. Spikelet solitary, terminal.
12. Leaves bladeless or nearly so; glumes imbricate.
13. Culms filiform, less than 15 cm tall; spikelets less than 6 mm long, few-flowered, erect. 33. *F. pauciflora*.
13. Culms as thick as wire, 20–50 cm tall; spikelets 6–10 mm long, many-flowered, usually more or less oblique. 34. *F. nutans*.
12. Leaves long-bladed; glumes 2-ranked at least in part.
- 35. *F. monostachyos*.

MARIANAS: GUAM: 2 km north of Agat. *Necker* 59! (US), Mt. Lamlam,
1000 ft. *Moore* 223! (US); Guam, without definite locality. *McGregor* 441 & 537!
(the latter isotype of f. *hemisphaerica* Kükenth.) (US), *Guam Exp. Sta. Herb.*
241! (BISH).
WEST CAROLINES: YAP: without definite locality. *Wong* 322! (BISH,
US), *Volkens* 124 & 286 (B); Dogol Islet. *Tuyama* s.n.! (TI).—PALAU: Aimiriik.
Kanehira & *Hatusima* 4497! (FU); Babelthaob Islet, Molegojok. *Tuyama* s.n.!
(TI); Korror Islet. *Kobayashi* s.n.! (TI).—Also Formosa.

In my previous treatment I have attributed *F. tainanensis* to a variety of *F. complanata* because of its vegetative parts: particularly strongly compressed culms and much reduced leaf blades. However, as I have remarked in my later paper (T. Koyama, 1961), a valid difference between *F. autumnalis* and *F. complanata* is in glumes that are 1.5–2 vs. 3–3.5 mm long. According to this point *F. tainanensis* seems to be better treated as a subspecies of *F. autumnalis* rather than that of *F. complanata*. Achenes of ssp. *tainanensis* that are definitely smaller than those of *F. complanata* also support the present transfer.

27. *Fimbristylis cymosa* R. Br., Prodr. Fl. Nov. Holl. 1, 228, 1810.

ssp. **umbellato-capitata** (Hillebr.) T. Koyama, stat. nov.

F. cymosa R. Br. var. *umbellato-capitata* Hillebr., Fl. Hawai. Isls. 473, 1888; Kükenth. in Engl., Bot. Jahrb. 59: 6, 1924; Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 262, 1935; Walker & Rodin in Contrib. U.S. Nat. Herb. 30: 457, 1949.

'*F. spathacea* (non Roth)': Safford in Contrib. U.S. Nat. Herb. 9: 277, 1905; Merrill in Philip. Journ. Sci. (Bot.) 9: 61, 1914.

F. cymosa R. Br. var. *pycnocephala* (Hillebr.) Kükenth. ex F. Brown, Fl. Southeast. Polynes. 1: 104, 1931; Christophelsen in Bull. B. P. Bishop Mus. 128: 20, 1935.

F. glomerata (Retz.) Nees (in Linnaea 9: 290, 1834, nomen) ex Kunth, Enum. Pl. 2: 246, 1837; Kükenth. in Engl. Bot. Jahrb. 59: 5, 1924.

'*F. cymosa* (non R. Br.)': Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 278, 1935; Ohwi in Journ. Jap. Bot. 18: 133, 1942.

Tufted in clumps from very short rhizome. Leaves basal, densely tufted, the blade linear, thickish, stiffish, 5–30 cm long, 1.4–4 mm wide, recurved, abruptly acutish at apex, mostly smoothish on margins; sheaths dark brown, more or less disintegrating into fibers. Culms few, wiry, 10–60 cm tall, smooth. Inflorescence a simple umbel with few to several glomerules, sometimes partially sub-compound, or often congested to one large head; involucel leaves 1–3, much shorter than inflorescence; rays when present 1–5 cm long, unequal. Spikelets congested in globose head 5–10 mm in diameter, ovoid or ovoid-oblong, 4–6 mm long, about 2 mm across, obtuse-tipped, grayish rusty-brown. Glumes rhombic-ovate, rounded at apex, rusty brown or grayish-ferrugineous, keel ending below the hyaline apex, whitish hyaline margins very conspicuous. Achenes obovate, fuscous at maturity, 1 mm long, trigonous with obtuse dorsal angle; style branches 3.

GILBERT ISLANDS: Tarawa Atoll. Cameron s.n.! (BISH).—Also Japan, Ryukyus, Malaysia, Wake Is. and India.

There have been many opinions as to the taxonomy of the *Fimbristylis cymosa* complex, which is one of the most variable groups of the genus in tropical Asia. Recently Kern in Reinwardtia 5: 39, 1961, relegated *F. spathacea* to the synonymy of *F. cymosa*, whereas Ohwi (1944, 1953) recognized the two as specifically distinct. Blake (1954) separated *F. pycnocephala* from *F. cymosa* in his treatment of New Guinean Cyperaceae.

My knowledge of *E. cymosa* is rather poor, as I have seen only seven specimens of the species from Australia, where it was originally described. But, in my observation, the glumes of *F. cymosa* are relatively loosely arranged on smaller, ovoid-globose spikelets, and are grayish with sharp keel, whereas in *F. spathacea* of the Indian subcontinent and southeastern Asia, the glumes are tightly imbricate on more oblong spikelets, and are always rusty brown with more obtuse keel. Achenes of *F. cymosa* are 3-angled, grayish and dull, but those of *F. spathacea* are lenticular, brown and slightly shiny when completely mature. These minor differences do not warrant any specific separation but seem to be sufficient to make subspecific differentiation. *F. spathacea* is thus reinterpreted as a subspecies of *F. cymosa*.

The examination of the holotype and many paratypes of *F. atollensis* proved that it is quite identical with *F. cymosa* ssp. *spathacea*. When St. John described it he unfortunately did not compare his plant with *F. spathacea*, but with *F. cymosa* quite in detail. The differences pointed out by him, therefore, naturally agree with those between ssp. *cymosa* and ssp. *spathacea* just discussed.

In the Pacific islands there is another plant hitherto called *F. cymosa* or *F. pycnocephala*. It is superficially well characterized by always capitate-contracted spikelets, a character not belonging to either of the two subspecies of *F. cymosa*. Its trigynous achenes and more or less grayish glumes show the affinity with ssp. *cymosa*, but its oblong spikelets with tightly imbricate glumes are like those of ssp. *spathacea*. I believe it to be a geographical race of ssp. *cymosa* in the Pacific islands and call it ssp. *umbellato-capitata*, raising Hillebrand's variety to the rank of subspecies.

28. *Fimbristylis palauensis* Ohwi in Journ. Jap. Bot. 18: 134, 1942.

'*F. marianna* (non Gaudich.)': Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 261, 1935.

F. Fosbergiana T. Koyama in Bull. Arts & Sci. Div., Univ. Ryukyus, (Math. & Nat. Sci.) No. 3, 66, f. 16a-e & 17, 1959. Syn. nov.

Tufted perennial. Culms slender, 30–60 cm tall, about 1 mm thick, smooth. Leaves basal, narrowly linear, 1/2 to 3/4 as long as culms, 1–1.2 mm wide, stiff, canaliculate, abruptly acutish at apex; sheaths fuscous, more or less disintegrating

into fibers. Inflorescence a simple umbel, rarely partially subcompound, loosely with 3 to 9 spikelets, 4 cm long and as wide; involucral leaves 1-2 (-3), setaceous, about 1/3 as long as the umbel; rays up to 3.5 cm long, with 1 to 3 spikelets. Spikelets oblong-cylindrical, 8-15 mm long, 2-2.5 mm wide, terete, fulvous or fuscous, many-flowered, abruptly avute at apex. Glumes tightly imbricate, ovate-oval 4 mm long 2.5 mm wide, with 6 to 8 parallel veins on back, abruptly contracted at apex. Achenes obovate, biconvex, 1-1.2 mm long, 0.8 mm wide, light brown, smooth, stipitate with a conical gynophore; style 4.5-5 mm long, compressed, fimbriate, the upper 1/3 (branches) 2-cleft. [Illustr.] T. Koyama, l.c. figs. 16 & 17 on pp. 66-67, under *F. Fosbergiana*.

WEST CAROLINES: PALAU: Marukyoku. *Takamatsu* 1710! (BISH); Katalwell. *Tuyama s.n.*! (TI); Babelthaob Islet, Almonogui, Kamusetsu. *Hatusima* 4869! (FU, the holotype of *F. palauensis*), ditto *Kanehira & Hatusima* 4897! (FU); ditto Aimion in monte Ngarua. *Tuyama s.n.*! (TI); ditto, Mt. Luise-Almonogui. *Hosokawa* 6589! (US, the holotype of *F. Fosbergiana*; BISH & TAI, isotypes). Distribution: endemic to the western Carolines.

When I described *F. Fosbergiana* the holotype and paratype of *F. palauensis* were not at my disposal, and I at that time also found Ohwi's original description not agreeing with my plant. Ohwi's plants later examined by me bear very young spikelets in rather depauperated condition. The description given here is based on Hosokawa's and Tuyama's collections.

29. *Fimbristylis tristachya* R. Brown, Prodr. Fl. Nov. Holl. 1, 226, 1810; T. Koyama in Bull. Arts & Sci. Div., Univ. Ryukyu, (Math. & Nat. Sci.) No. 3, 66 f. 16f-g, 1959.

F. maxima K. Schumann ex Schumann & Hollr., Fl. Kais. Wilhelmsl. 24, 1889; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Merrill in Philip. Journ. Sci. (Bot.) 9: 61, 1914.

F. marianna Gaudich. var. *foenea* Kükenth. in Repert. Sp. Nov., Fedde, 16: 432, 1920.

Tufted from short ligneous rhizome. Culms few, slender, 15-70 cm tall, rigid, compressed, smooth, thickened at base. Leaves all basal, rather many; blades narrowly linear, 1-2 mm wide, up to 2/3 the length of culms, stiffish, glaucous-green, scabrid on margins, abruptly acutish at apex; sheaths yellowish-to chesnut-brown, eventually more or less disintegrating into fibers. Inflorescence umbelliform, sometimes compound, often reduced to 2 to several peduncled spikelets; involucral leaves 2 or 3, much shorter than to almost equaling the umbel; rays quite unequal, the longer up to 3.5 cm long. Spikelets broadly ovoid-ellipsoid, 6-10 mm long, 3.5-6 mm wide, stramineous-brown, abruptly contracted at apex, densely many-flowered. Floral scales broadly elliptic, 3.2-

3.8 mm long, about 3 mm wide, chartaceous, stramineous and parallelly several veined on back, brownish on membranous margins, contracted to mucronate apex. Achenes obovate-orbicular, 1–1.2 mm long, biconvex, constricted at apex, light brown, shiny, stipitate with cuneate gynophore; style 2 mm long, flattened, fimbriate; style branches 2, 0.8 mm long. [Illustr.] C. B. Clarke, Illustr. Cyper. t. 43 f. 12–14, 1909; T. Koyama, l.c., 1959.

MARIANAS: GUAM: without definite locality. *McGregor* 494! (BISH), *Nelson* 316! (BISH); Mt. Tenjo, 320 m. *Bryan*, Jr. 1100! (BISH), ditto, 900 ft. *Moore* 75! (US); ditto, *Rodin* 535! (US); near Talisay. *Fosberg* 35261! (BISH, US); south of s.e. of Umatac. *Fosberg* 35434! (BISH, US); south of Asan Point and Piti. *Anderson* 85! (BISH); plateau of Talofofo. *Hosaka* 3133! (BISH); Manengon, Stone 4844, 4530 (GUAM).

WEST CAROLINES: YAP: Kolonie in monte Kabul. *Tuyama* s.n.! (TI); near Fura Pond. *Hosokawa* 8860! (TAI); north of Gagil District. *Fosberg* 25606! (BISH, US); Kanif. *Takamatsu* 1926! (BISH); Yap, without definite locality. *Wong* 543! (US), *Volkens* 145! (US); Korror Islet: central plateau. *Hosaka* 3314! (BISH).—Also Malaysia and Australia.

In the external appearance, especially in the stramineous-brownish color of spikelets and the chartaceous, shiny glumes with several parallel veins, this species closely resembles *F. schoenoides*. It, however, differs from the latter by much longer anthers (2 vs. 0.7 mm) and styles (3 vs. 1.5 mm).

30b. ssp. *podocarpa* (Nees & Meyen) T. Koyama, stat. nov.

?*F. affinis* Presl, Reliq. Haenk. 1: 191, 1928.

F. podocarpa Nees & Meyen ex Nees in Wight, Contrib. Bot. Ind. 98 (ex p.), 1834.

F. annua Römer & Schult. var. *podocarpa* (Nees & Meyen) Kükenth. in Engl., Bot. Jahrb. 5A: 5, 1924.

F. dichotoma Vahl var. *pallidisquama* Ohwi in Journ. Jap. Bot. 18: 135, 1942. Syn. nov. e typo.

Achenes trabeculate with 12 to 20 rows of rectangular epidermal cells, conspicuously stipitate with a gynophore, otherwise as in ssp. *dichotoma*. [Illustr.] C. B. Clarke, Illustr. Cyper. t. 42, f. 3–4 (under *F. diphyllea* var. *pluristriata*) and f. 5–6, 1909.

MARIANAS: Agrigan. *Hosokawa* 7973! (TAI); Anatahan. *Hosokawa* 7865! (TAI); Saligan. *Kanehira* 2166! (FU; type of var. *pallidisquama*); Alamagan. *Hosokawa* 7917! (TAI); "In insulis Marianis". T. Haenke 24333! (Photo in BISH; type of *F. affinis*).

EAST CAROLINES: PONAPE: Kolonia. *Kanehira* 680! (FU); Nut village. *Hosokawa* 5548! (TAI); ditto, near Kaamal. *Hosokawa* 5490! (TAI).—Also India, Malaysia and Polynesia.

I regard *F. podocarpa* as a subspecies of *F. dichotoma*. Except for the difference in achenes it cannot be separable from the latter. In ssp. *dichotoma* achenes are trabeculate with 6 to 10 rows of transversely oblong external cells and the transverse septae are as conspicuous as the longitudinal lines, but in ssp. *podocarpa* the achenes have 12 to 20 rows of very fine transversely rectangular cells and the longitudinal lines, which are more or less stronger than those of

ssp. *dichotoma*, are more ridged than the weak transverse septae. Under a low-power lens, the achenes of ssp. *podocarpa* thus look as if they were striped whereas those of ssp. *dichotoma* are conspicuously tessellate.

30c. ssp. *longispica* (Steud.) T. Koyama in Journ. Fac. Sci. Univ. Tokyo III, 8: 112, 1961.

F. longispica Steud., Synops. Pl. Glum. 2, 118, 1855.

F. annua Römer & Schultes var. *pseudo-ferruginea* Kükenth. in Engl., Bot. Jahrb. 59: 5, 1924.

F. dichotoma Vahl var. *hahajimensis* (Tuyama) Ohwi in Journ. Jap. Bot. 18: 135, 1942.

Leaf blades 1–1.5 mm wide, the sheaths more castaneous; spikelets 7–15 mm long, few in pseudolateral reduced corymb.

WEST CAROLINES: PALAU: Marakal, near Koror. *Hatusima* 4703! (FU); Koror Islet. *Ledermann* 14174 (B, K).

EAST CAROLINES: PONAPE: without definite locality. *Ledermann* 13561 & 13589 (B, K).—Also Bonin Islands, Japan, and southern Korea.

Subspecies *longispica* habitually differs from all the other subspecies of *F. dichotoma* as it grows in a saline habitat. In Micronesia, in the Volcanic Islands and Idzu Islands it becomes dwarfed with narrow leaves and the inflorescence of a few digitate spikelets as described above, but in the mainland of Japan it bears broader leaves up to 4 mm wide and larger corymbose inflorescence with several rays when it grows on shores of brackish lagoons. However, in most cases it is difficult to differentiate var. *pseudo-ferruginea* from typical ssp. *longispica*.

30d. ssp. *boninensis* (Hayata) T. Koyama, stat. nov.

F. boninensis Hayata, Icon. Pl. Formosa 6: 109, 1916.

F. urakasiana Kükenth. in Engl., Bot. Jahrb. 59: 5, 1924; Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 262, 1935.

Spikelets usually aggregated in hemispherical heads on short rays, oblong-lanceolate, (6–) 8–12 mm long, 3 mm wide; anthers 1.5–1.8 mm long; plants tufted in large clumps; leaves stiffish, up to 5 mm wide, aggregated at culm-bases.

MARIANAS: Anatahan. *Hosokawa* 7842! (TAI, BISH), & 7875! (TAI).—Pagan, Mt. Pagan. *Hosokawa* 7955 & 7958! (TAI).—Urkas, auf der Asche des Vulkans. *Gibbon* 1158 (B, type of *F. urakasiana*, n.v.).—Also Bonin Islands.

I have not seen the type of *F. urakasiana* but Kükenthal's description is clear enough to identify it with *F. boninensis*. This plant might be an extraordinary large form of polymorphous ssp. *dichotoma*. The two plants agree with one another at least achene and glumes, however, with the longer anther as much as 1.5 mm long *F. boninensis* comes closer to ssp. *longispica*.

31. ***Fimbristylis littoralis*** Gaudich. in Freyc., Voy. Bot. 413, 1826.

Hatusimae*); ditto, Ngarsul. *Tuyama*, s.n.! (TI); Garudokku. *Takamatsu* 1399! (BISH); Aimiriik. *Watanabe*, s.n. in part! (TI).

EAST CAROLINES: PONAPE: without definite locality. *Kanehira* 678! (FU, TAI, TI), Ledermann 13513 (B), *Hatusima* 10744! (FU); Wone. *Takamatsu* 1024! (BISH); Agr. Exp. Sta. Glassman 2413! (BISH); Kichi village. Rehtau. *Hosokawa* s.n.! (TAI); Oa. *Takamatsu* 904! (BISH); George Islet, George village. *Hosokawa* 6059! (TAI).—Ifaluk Atoll, Falalap. Abbott & Bates 118! (BISH).—KUSAIE: Okat River. *Hosokawa* 9468! (TAI).—Distribution: pantropic.

F. Hatusimae, later reinterpreted as *F. miliacea* var. *Hatusimae*, is here relegated to the synonymy of *F. littoralis*. It was originally segregated from *F. littoralis* (= *F. miliacea*, excl. basionym) by smaller spikelets and possibly pale basal sheaths less compressed than in *F. littoralis*. Spikelets of very variable *F. littoralis* range from 1.8 to 5 mm in length, and less compressed pale basal sheaths are rather common in plants from tropical America. Var. *Hatusimae* is, therefore, completely included within the range of *F. littoralis*. In my previous paper (T. Koyama, 1959) I have cited some specimens from Marianas and western Carolines under the name of *F. Koidzumiana* because of their larger spikelets up to 5 mm in diameter. They are, however, redetermined as *F. littoralis* for the same reason. The validity of *F. Koidzumiana* is very doubtful. *F. littoralis* is a correct name of what has long been called *F. miliacea*. As the Linnaean type of *Scirpus miliaceus*, on which *F. miliacea* was based is a specimen of *F. quinquangularis*, *F. miliacea* replaces *F. quinquangularis*. Examining the phototypes of Linnaean Cyperaceae I am in full agreement with S. T. Blake (1954) as to the nomenclature of *F. miliacea*.

32. *Fimbristylis globulosa* (Retz.) Kunth, Enum. Pl. 2: 231, 1837; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Safford in Contrib. U.S. Nat. Herb. 9: 277, 1905; Merrill in Philip. Journ. Sci. (Bot.) 9: 61, 1914; Kükenth. in Engl., Bot. Jahrb. 59: 5, 1924; Kanehira in Journ. Fac. Agr. Kyushu

Univ. 4: 278, 1935; Ohwi in Journ. Jap. Bot. 18: 134, 1942.

Scirpus globulosus Retz., Obs. Bot. 6, 19, 1791.

F. hypsocolea Hosokawa in Trans. Nat. Hist. Soc. Formosa 28: 152, 1938.

Syn. nov. e typo. (Pl. 2, fig. A)

Culms densely tufted, (30-) 40–90 cm tall, clothed at base with 2 or 3 bladeless sheaths oblique at orifice. Inflorescence a simple or partially compound umbel with several spikelets; rays few, up to 3 cm long; involucral leaves 2 or 3, about 1 cm long. Spikelets obovoid-ellipsoid to globose, 3–4 mm long, 2.5–3 mm wide, fuscous or rusty-brown. Glumes oblong, 2 mm long, rounded at apex, broadly white-hyaline on margins. Achenes obovate, biconvex, 0.7 mm long, minutely cancellated; style-branches 3 or 2.

MARIANAS: GUAM: Agana swamp. Bryan, Jr. 1081! (BISH).

WEST CAROLINES: YAP: Wong 495! (BISH, US), Volkens 140, 293 (B).

—PALAU: Babelthaob Islet, Kamusetsu. Kanehira & Hatusima 6960! (FU); ditto, Molegojok. Tuyama s.n.! (TI); Aimiriik. Kanehira & Hatusima 4590! (FU); between Aimiriik and Gaspan. Tuyama s.n.! (TI); Korror Islet, Ngarabaket. Tuyama s.n.! (TI); Korror Agr. Exp. Sta. Collector unknown 95! (TAI; holotype of *F. hypsocolea*).

EAST CAROLINES: PONAPE: without definite locality. Hatusima 10764 & 11084! (FU), Ledermann 13613a (B); Mt. Poaiopai, 1600 ft. Glassman 2484! (BISH).—Also India, Indo-China, southern China, Formosa, Ryukyus, Malaysia and Polynesia.

The holotype of *F. hypsocolea* was examined at the National Taiwan University Herbarium at Taipei. As seen in Pl. 3, fig. A, it is nothing else than the very common form of *F. globulosa*. As was already pointed out by Ohwi (1944), the achenes of this species tend from trigyny to digyny. In plants from Micronesia lenticular achenes were slightly more abundant than the trigonous ones.

33. **Fimbristylis pauciflora** R. Brown, Prodr. Fl. Nov. Holl. 1, 225, 1810; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Kükenth. in Engl., Bot. Jahrb. 59: 4, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 279, 1935.

Culms hair-like, densely tufted in large clumps, 5–20 cm tall; basal sheaths few, 1–3 cm long, light brown, membranous, oblique at orifice, sometimes with setaceous blade. Spikelet solitary, terminal, oblong-elliptic to lance-oblong, 4–6 mm long, 1–1.2 mm across, pale-brownish, few-flowered. Glumes erect, lance-oblong, 2.8–3 mm long, 1–1.2 mm wide, obsoletely several-nerved, the back obtuse, cinereous-green, the margins narrowly rusty-brownish, obtusish at apex. Achenes obovate, 0.7–0.8 mm long, 0.5 mm wide, unequally biconvex with very depressed dorsal angle, rounded at apex, tawny at maturity, sparsely verruculose; style slender, 1.7 mm long, 3-cleft to 1/4.

WEST CAROLINES: YAP: Dogol. Tuyama s.n.! (TI); between Dogol and Okao. Hosokawa 8907! (BISH, TAI); oppido Okau. Tuyama s.n.! (TI); without definite locality. Volkens 448 (B).—PALAU: Ogiwaru. Takamatsu 1443! (BISH).

—Also southern Ryukyus, Malaysia and northern Australia.

34. **Fimbristylis nutans** (Retz.) Vahl, Enum. Pl. 2: 286, 1806; Volkens in Engl., Bot. Jahrb. 31: 458, 1902; Kükenth. in Engl., Bot. Jahrb. 59: 4, 1924; Ohwi in Journ. Jap. Bot. 18: 133, 1942.

Genus 9. CYPERUS Linn.

1. Rhachilla on spikelet not articulated.
2. Achenes 3-angled. (Subgen. CYPERUS).
 3. Spikelets spicate on elongated rhachis.
 4. Rhachilla of spikelet winged with decurrent bases of glumes; styles twice as long as the achene.
 5. Spikelets stramineous, dense-flowered; spikes cylindrical with numerous spikelets, much longer than the width. 36. *C. digitatus*.
 5. Spikelets sanguineous except in no. 38, which has yellow spikelets, loose-flowered; spikes ovoid or ellipsoid with many spikelets, not more than twice as long as the width.
 6. Stolons absent; glumes loosely disposed.
 7. Large plant; culms up to 100 cm tall; spikelets sanguineous-reddish. 37. *C. distans*.
 7. Medium-sized plant; culms less than 60 cm tall; glumes yellowish. 38. *C. tenuiculmis*.
 6. Rhizome with slender, elongate stolons; glumes contiguous. 39. *C. rotundus*.
 4. Rhachilla of spikelet not winged, i.e. glumes without decurrent base; styles shorter than achene.
 8. Plant perennial, stoloniferous; glumes with obtuse keel. 40. *C. pilosus*.
 8. Plant annual with fibrous roots only; glumes strongly folded with acute keel.

9. Spikelets 5–8 mm long, few-flowered; glumes 1–1.5 mm long, round or shallowly emarginate at apex. 41. *C. Iria*.
9. Spikelets 1–2.5 cm long, many-flowered; glumes 3–3.5 mm long, acuminate at apex. 42. *C. compressus*.
3. Spikelets radiate at the apex of umbel rays; rhachis of spikes not developed.
10. Involucral leaves few, very unequal; culms slender, less than 70 cm tall; spikelets brownish.
11. Spikelets densely congested in glomerules; glumes sanguineous, rounded at apex; annual with fibrous roots only. 43. *C. difformis*.
11. Spikelets radiate in group of 3 to 7; glumes ferrugineous, acute at apex; perennial usually with elongate stolons. 44. *C. haspan*.
10. Involucral leaves many, nearly equal; culms robust, 80–100 cm tall; spikelets pale-green. ... 45. *C. alternifolius* ssp. *flabelliformis*.
2. Achenes lenticular. (Subgen. PYCREUS).
12. Spikelets dense; umbel rays as a rule not developed, rarely elongate to 3 cm; achenes not sulcate. 46. *C. polystachyos*.
12. Spikelets loose; umbel rays usually elongate to 7 cm; achenes sulcate. 47. *C. sulcinux*.
1. Rhachilla of spikelet articulate at least at the base of spikelet.
13. Achenes 3-angled.
14. Spikelets articulate only at base. (Subgen. MARISCUS).
15. Spikelets linear or linear-subulate, not compressed.
16. Spikelets spicate, greenish.
17. Spikelets divergent; spikes truly cylindrical. 48. *C. cyperoides*.
17. Spikelets obliquely patent; spikes narrowed toward the base. 49. *C. cyperinus*.
16. Spikelets congested in globose head, reddish-brown. ... 50. *C. compactus*.
15. Spikelets lanceolate, flat.
- 15b. Spikelets 6–7 mm long when normally grown, light brown or straw-colored, rather dense but the axis of spikes being still visible. 51. *C. javanicus*.
- 15b. Spikelets 3–6 mm long, light fuscous or grayish-fuscous, extremely dense thus the axis of spikes completely hidden. 51B. *C. ligularis*.
14. Spikelets articulate at base of all the glumes. (Subgen. TORULINIUM). 52. *C. ferax*.
13. Achenes lenticular.

18. Spikelets and achenes laterally compressed, an angle of achenes facing the rhachilla. (Subgen. *KYLLINGA*).
 19. Glumes not winged on the keel. 53. *C. brevifolius*.
 19. Glumes winged on the keel. 54. *C. Kyllingia*.
 18. Achenes dorsiventrally compressed with one side facing the rhachilla; spikelets with obtuse back. (Subgen. *LIPOCARPHA*).
 55. *C. Zollingerianus*.
- 36. *Cyperus digitatus* Roxb.** [Hort. Beng. 81, 1814, nomen &] Fl. Ind. ed. 1, 1: 205; 1832; Ohwi in Journ. Jap. Bot. 18: 131, 1942.

- 38. *Cyperus tenuiculmis*** Böckeler in Linnaea 36: 286, 1870.
'Cyp. Zollingeri' (non Steud.)': Volkens in Engl., Bot. Jahrb. 31: 457, 1902; Ohwi in Journ. Jap. Bot. 18: 131, 1942.
 [Practical descr.] Kükenth., Cypereae, 133, 1935; Ohwi, l.c. 131, 1944 (both under *C. Zollingeri*). [Illustr.] Kern in Reinwardtia 2: 108, f. 6, 1952, under *C. Zollingeri*.
 WEST CAROLINES: YAP: am Rande der Buschgehörtze des Benningsenbergs, 200 m. *Volkens* 211 (B); Grashalde am Missionberg. *Volkens* 386 (B).—PALAU: Babelthaob Islet: west coast, Ngeremetengel. *Fosberg* 32451! (BISH); Almonogui. *Kanehira & Hatusima* 4011! (FU); Alkoron. *Hosokawa* 7018! (TAI); Ngarudokku. *Takamatsu* 1263! (BISH); Gokkep. *Takamatsu* 1183! (BISH); Korror Islet. *Kanehira & Okuya* 1! (FU); Korror, Steppe. *Raymundus* 159 (B).
 EAST CAROLINES: TRUK: without definite locality. *Hatusima s.n.*! (FU); ditto. *Kawagoë s.n.*! (KAG); ditto, am Berger Vidiboen. *Kraemer* 12 (B).—Also Africa, India, Malaysia and Formosa.
 Kern (1954) settled the nomenclature of this taxon, which has passed under the name of *C. Zollingeri*. According to him, as the type of *C. Zollingeri* is identical with *C. Ramosii* of the same section, the correct name of this species should be *C. tenuiculmis*.
- 39. *Cyperus rotundus* Linn.**, Sp. Pl. ed. 1, 45, 1753; Volkens in Engl., Bot. Jahrb. 31: 457, 1902; Merrill in Philip. Journ. Sci. (Bot.) 9: 59, 1914; Kükenth. in Engl., Bot. Jahrb. 59: 3, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 277, 1935; Ohwi in Journ. Jap. Bot. 18: 131, 1942.
 [Practical descr.] Kükenth., Cypereae 107, 1935; Ohwi, l.c. 130, 1944. [Illustr.]

Kükenth., l.c. f. 13 on p. 109, 1935; S. T. Blake in Univ. Queensl. Papers 2 (2) : t. 4, 1942.

MARIANAS: GUAM: without definite locality. *McGregor* 445! (BISH, US); 1/2 mile west of Agana Bay area. *Moore* 156! (US).—Tinian. *Ohtani* 9796! (FU).

WEST CAROLINES: YAP: without definite locality. *Wong* 469! (US). *Volkens* 120 & 121 (B); Dogol village. *Tuyama s.n.*! (TI); Takiol. *Takamatsu* 1822b! (BISH).—PALAU: Angaur. *Fosberg* 31972! (BISH, US), ditto. *Momose* s.n. (TI).

MARSHALLS: Arno Atoll, Ine Islet, Ine village. *Anderson* 3674! (BISH), *E. L. Stone* 1038! (US); Jaluit. *Schnee* s.n. (B).

WAKE IS.: Peale Islet. *Fosberg* 34933! (BISH, US); Wake Islet. *Fosberg* 34948! (BISH).—Distribution: temperate and tropical regions of all World.

Valiability and taxonomy were discussed in detail by S. T. Blake (1942). The tubers containing cyperene, cyperole and phenole compounds are used for Chinese drug.

40. *Cyperus pilosus* Vahl, Enum. Pl. 2: 354, 1806.

[Practical descr.] Kükenth., Cypereae 92, 1935; Ohwi, Cyper. Jap. 2: 134, 1944.

WEST CAROLINES: PALAU: Babelthaob Islet, Lake Ngelegal. *Tuyama* s.n.! (TI); Korror Islet, Ngarabaket. *Tuyama* s.n.! (TI).—Also Africa, India, Indo-China, southern China, southern Japan, Malaysia and Australia.

This species is apparently new to the flora of Pacific Islands, and is a good example suggesting the close phytogeographic link between Micronesia and Malaysia. Both specimens cited above have slightly broader spikelets that are densely congested than in the plants from Indian subcontinent, and are close to var. *pseudo-babakensis* Kükenth.

EAST CAROLINES: PONAPE: without definite locality. *Hatusima* 11066! (FU).—Distribution: pantropic.

C. haspan closely resembles *C. tenuispica*, from which it differs by slightly smaller achenes and the shape of the glumes. As illustrated by Kükenthal (1936), in *C. haspan* the glumes are contiguous with a short upright mucro, whereas in *C. tenuispica* they are slightly loosely disposed with a more or less recurved mucro. Ohwi (1942) identified some of the Hatusima numbers cited above as

C. tenuispica possibly because of the absence of stolons and more or less elongated leaf blade. However, these vegetative characters are not always confined to *C. tenuispica*, and *C. haspan* presents a very similar appearance when it grows in dry habitats. All related Micronesian specimens can be determined as *C. haspan* by the floral characters mentioned above.

45. *Cyperus alternifolius* Linn., Mant. Pl. 2: 28, 1771.

ssp. ***flabelliformis*** (Rottb.) Kükenth., Cypereae, in Engl., Pflanzenr. Heft. 101: 193, 1936.

Cyp. flabelliformis Rottb., Descr. & Icon. Rar. Pl. 42, t. 42 f. 2, 1773; Merrill in Philip. Journ. Sci. (Bot.) 9: 59, 1914.

[Practical descr.] Kükenth., l.c.

MARIANAS: GUAM: without definite locality. *Nelson* 550! (BISH, NY), *Guam Exp. Sta. Herb.* 210! (BISH, US).

WEST CAROLINES: PALAU: Korror Islet, Ngerebe'ed, 5–10 m alt. *Fosberg* 32248! (BISH, US).—Also Africa. Naturalized in Okinawa and the Bonin Islands.

The Micronesian plants of this species are undoubtedly of introduced origin. In tropical and subtropical Asia it is often cultivated for ornamental purposes and then established from escaped stocks.

46. *Cyperus polystachyos* Rottb., Descr. & Icon. Rar. Pl. 39, t. 11 f. 1, 1773;

Kükenth. in Engl., Bot. Jahrb. 59: 3, 1924; Kanehira in Journ. Fac. Sci. Kyushu Univ. 4: 277, 1935; Ohwi in Journ. Jap. Bot. 18: 132, 1942.

WEST CAROLINES: YAP: grassige Bergabhänge. Volkens 94 & 143 (B).—PALAU: Koror Islet. Kanehira & Okuya s.n.! (FU), Kanehira & Hatusima 4441 & 4823! (FU), Raymundus 154 & 228 (B), Hosokawa 22! (TAI); Peliliu Is. Hatusima 4769! (FU).

EAST CAROLINES: Truk. *Hatusima s.n.*! (FU).—PONAPE: without definite locality. *Hosokawa 6142!* (TAI), *Ledermann 13512* (B, K); Agr. Exp. Sta. *Glassman 2425!* (BISH); Langar Islet. *Glassman 2396!* (BISH); U. District. *Glassman 2722!* (BISH); Colonia, *Stone 1972!* (GUAM).—India, southern China, Malaysia, Bonin Islands and eastern Australia.

As compared with the plants from Malaysia and India, Micronesian specimens are usually depauperate with more slender culms and looser spikelets, and the spikes are more frequently congested in a head. This form was cited by Ohwi under the name of forma *pictus* (Nees ex Wight) Ohwi in Journ. Jap. Bot. 18: 132, 1942.

50. *Cyperus compactus* Retz., Observ. Bot. Pt. 5, 10, 1789.

[Practical descr.] Kükenth., Cypereae 423, 1936; Ohwi, Cyper. Jap. 2: 159, 1944.

MARIANAS: GUAM: OSIR Road, edge of Apra Harbor, coral flat, very weedy. *Stone 4725!* (DAO, GUAM).—Also India, southern China, Formosa and Malaysia.

Apparently not previously recorded from the Pacific Islands. This new addition is a further example suggesting a floristic link between tropical Asia and western Micronesia (cf. note under *C. digitatus*).

51. *Cyperus javanicus* Houttuyn, Nat. Hist. 2: 13, t 88 f. 1, 1782; Walker & Rodin in Contrib. U.S. Nation. Herb. 30: 456, 1949.

Cyp. stuppeus Forst. f. [Fl. Ind. Austr. Prodr. 89, 1786, name only; Kükenth. in Engl., Bot. Jahrb. 59: 3, 1924, name only] ex Kükenth., l.c. 59: 45, 1924.

Cyp. pennatus Lamarck, Illustr. 1: 144, 1791; Ohwi in Journ. Jap. Bot. 18: 132, 1942.

The Linnaean name, *C. odoratus*, is accommodated to this species by some authors. According to the phototypes of the Linnaean Herbarium, a sheet marked as "10. *odoratus*" in Linnaeus' hand is a mixture of *C. polystachyus* and *C. malaccensis*, hence some other authors retain the binomial for *C. polystachyus* of the Subgen. *Pycreus*. On the other hand the Sloan Plates cited by Linnaeus under his *C. odoratus* are again a mixture of *C. giganteus* of the section *Papyrus* and a species of *Mariscus* that cannot be identified exactly. I agree with C. B. Clarke (1894) to treat this very confusing name as a nomen rejiciendum.

55. *Cyperus Zollingerianus* (Böcklr.) T. Koyama in Bot. Mag. Tokyo 73: 438, 1960.

Lipocarpha microcephala Kunth, Enum. Pl. 2: 1837; *Hosokawa* in Trans. Nat. Hist. Soc. Formosa 28: 152, 1938; Ohwi in Journ. Jap. Bot. 18: 137, 1942.

[Practical descr.] Ohwi, l.c. 167, 1944, under *Lipocarpha microcephala*.

Genus 10. MACHAERINA Vahl

1. Achenes almost lanceolate, gradually narrowed to glabrous beak; glumes black-brown, much longer than achene; leaves 1.2–2 cm wide. 56. *M. falcata*.
 1. Achenes elliptic, abruptly contracted to densely hairy beak; glumes rusty-brown, slightly shorter than achene; leaves 3–8 mm wide.
 2. Spikelets 3–4 mm long, solitary or in groups of 2 or 3; beak of achenes about 1 mm long. 57. *M. mariscoides* ssp. *mariscoides*.
 2. Spikelets 2.5–3 mm long, congested in globose head; beak of achenes 2/3–3/4 mm long. 57b. *M. mariscoides* ssp. *colpodes*.
56. **Machaerina falcata** (Nees) T. Koyama in Bot. Mag. Tokyo 69: 63, 1956.
Baumea falcata Nees in Hook., Journ. Bot. 6: 29, 1854.
Cladium ponapense Ohwi in Journ. Jap. Bot. 18: 136, 1942. Syn. nov.
e typ.

[Practical descr.] Kükenth. in Repert. Sp. Nov., Fedde, 51: 144, 1942.

[Illustr.] Pl. 4, fig. D, E.

EAST CAROLINES: PONAPE: Mt. Nan-a-raut, summit, 750 m. *Hatusima* 11036! (FU, holotype of *Cladium ponapense*), *Hosokawa* 5988! (TAI), *Takamatsu* 1075! (BISH).—Also Malaysia and Polynesia.

I agree with Kükenthal and Kern that *Cladium dissolutum*, *C. malesicum* and *C. samoense* are identical with the present species. Furthermore, *C. Bidwellii* of the Hawaiian Islands seems to me to be identical or at most not more than a subspecies of *M. falcata*.

57. **Machaerina mariscoides** (Gaudich.) Kern in Act. Bot. Neerl. 8: 266, 1959.
ssp. *mariscoides*

Baumea mariscoides Gaudich. in Freyc., Voy. Bot. 417, 1829.

'*Cladium Meyenii* Drake': Volkens in Engl., Bot. Jahrb. 21: 458, 1901.

Cladium Gaudichaudii W. F. Wight ex Safford in Contrib. U.S. National Herb. 9: 230, 1905; Merrill in Philip. Journ. Sci. 9: 59, 1914; Kükenth. in Engl. Bot. Jahrb. 59: 7, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 276, 1935; Ohwi in Journ. Jap. Bot. 18: 136, 1942.

Culms from thick rhizome, more or less aphyllodic, up to 90 cm tall, laterally compressed, 3.5–4 mm wide, few-noded. Bladed leaves all on culms, spaced, laterally compressed, acute at apex, cinereous-green, the longer overtopping the culm. Inflorescence an ablong panicle, 15–30 cm long; partial panicles 5 or 6, the lower ones interrupted; lower bracts much longer than panicle. Spikelets in group of two to four, rarely solitary, 3–4 mm long, ovoid, glumes 3–4, of which 1–3 being flower-bearing, lance-ovate, acute, rusty-brown, sparsely pubescent at least on the upper part. Achene only one to a spikelet, including beak about 3 mm long, the body elliptic, 2–2.2 mm long, obscurely 3-angled, glabrous, amber-brown, shiny with irregular depressions; the beak subulate-lanceolate, 1 mm long, densely hispid with white hairs; stigmas 3. Stamens 3.
[Pl. 4: fig. A, B]

57b. ssp. *colpodes* (Lauterb.) T. Koyama, stat. nov.

Cladium colpodes Lauterb. in K. Schum. & Lauterb., Fl. Deutsch. Schutzgeb. Südsee 59, 1905; Kükenth. in Engl., Bot. Jahrb. 59: 7, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 276, 1935.

Cladium glomeratum (Gaudich.) H. Pfeiff. in Repert. Sp. Nov., Fedde, 23: 349, 1927, not of R. Br.

Cladium globiceps C. B. Clarke var. *colpodes* (Lauterb.) Kükenth. in Bull. Jard. Bot. Buitenz. III, 16: 310, 1940.

Culms and leaves narrower; inflorescence mostly less than 20 cm long; spikelets 2.5–3 mm long, congested in heads 5–8 mm across; achenes with shorter beak 2/3–3/4 as long as the achene body; otherwise as in ssp. *mariscoides*. [Pl. 4: fig. C]

WEST CAROLINE: PALAU: Babelthuap: Gaspan, by stream bank. *Stone* 4658! (GUAM); Eiraij. *Tuyama s.n.*! (TI); Ngatkip. *Ledermann* 14483 (B, K).—also Malaysia.

I am unable to keep *Cladium colpodes* as specifically distinct from *Macherina mariscoides* (= *Cladium Gaudichaudii*). Both plants are very similar in both vegetative and floral characters except for the shorter beak of the achenes. Although the achene beaks of *C. colpodes* are slightly shorter and more conical than those of *M. mariscoides*, they quite well agree in elliptic, amber-brown body with irregular depressions and in the beaks that are densely hispid with straight, white hairs. Differences in size and arrangement of spikelets mentioned in the above description are too trifling to make specific segregation. I regard *C. colpodes* as a subspecies of *M. mariscoides* as they are geographically separated in spite of the minor morphological differences. Subspecies *colpodes* is known in Malaysia under the name of *C. juncoides*.

Kükenthal (1942) is of the opinion that *M. mariscoides* is conspecific with the Hawaiian *M. Meyenii*, and regarded the former as the variety of the latter. In 1959 I have compared the selected sheets of *M. mariscoides* with a good series of *M. Meyenii* at the herbarium of the Bernice P. Bishop Museum in Honolulu. Differences are, after all, only in the slightly longer achenes and spikelets of

M. Meyenii. I here treat it also as a subspecies of *M. mariscoides* chiefly because of its clear geographical separation. As to the dimension of achenes and spikelets *M. mariscoides* ssp. *mariscoides* is intermediate between ssp. *Meyenii** and ssp. *colpodes*.

Genus 11. SCHOENUS Linn.

1. Culms rigid, more than 1 mm thick and 50 cm tall, erect from very base, never rooting at lower nodes.
2. Culms naked, i.e. clothed at base with a few bladeless sheaths only.
 - 58. *Sch. tendo* ssp. *achaetus*.
2. Culms phyllopedic, i.e. basal leaves with elongate blade.
 3. Spikelets less than 7 mm long. 59. *Sch. punctatus*.
 3. Spikelets more than 15 mm long. 60. *Sch. calostachyus*.
1. Culms filiform, soft, less than 1 mm thick and 40 cm tall, the lower part ascending and rooting at nodes. 61. *Sch. philippinensis*.
58. ***Schoenus tendo*** Hook, fil., Handb. N. Zeal. Fl. 298, 1867.
 ssp. ***achaetus*** T. Koyama, ssp. nov., intermedialis inter *Schoeno tendo* et
S. laevinuce, differt a anteriore setis hypogynis deficientibus et glumis
 fuscis, et a posteriore glumis dorso non hispidis, nucibus stramineis non
 albescensibus et inflorescentia multo depauperata. (Pl. 4, fig. G)
'Schoenus melanostachyus' R. Br.: as misapplied by Hosokawa in Trans.
 Nat. Hist. Soc. Formosa 28: 153, 1938.
'Schoenus laevinux' Ohwi: Ohwi in Journ. Jap. Bot. 18: 136, 1942. Concerning only the specimens cited, excluding basionym.

Culms more or less tufted or closely 1-rowed from short horizontal rhizome, 40–70 cm tall, smooth, terete, sulcate when dry, clothed at base with a few bladeless sheaths tinged with sanguineous-purple. Panicle erect, oblong to narrowly oblong, rather dense, 3 to 7 cm long, 1 cm wide, with 2 or 3 tufts of spikelets; bracts with sanguineous-fuscous sheath, the blade up to 5 cm long. Spikelets lance-ovate, more or less falcate, single or paired, compressed, 4–5 mm long, about 1.5 mm wide, fuscous; glumes 6 or 7, the lower smaller and vacant, the fruiting ones 1 or 2, lance-ovate, sometimes sparsely hispidulous on back, the upper margins lighter-colored, subdensely ciliate. Achenes obovoid, trigonous with conspicuous angles, 0.8–1 mm long, smoothish, stramineous at maturity, short-stiped at base, the style 2.5 mm long, stigmas 3; perianth bristles none. Stamens 2.

EAST CAROLINES: PONAPE: without definite locality. *Hatusima* 11015! (FU, holotype of ssp. *achaetus*) & 11016! (FU); Mt. Trunanshapoi in Nan-a-raut.

* *Machaerina mariscoides* Kern ssp. ***Meyenii*** (Kunth) T. Koyama, stat. nov.

Baumea Meyenii Kunth, Enum. Pl. 2: 314, 1837.

Cladium Meyenii (Kunth) Drake, Illustr. Fl. Is. Mar. Pac. 2: 335, 1890–92.

Distribution: Hawaiian Islands.

Hosokawa 5987! (BISH, TAI); Mt. Ninani, 2500 ft. alt. *Glassman* 2889! (BISH).—Distrib. endemic.

As the above diagnosis shows, the new taxon differs from *Schoenus tendo* of New Zealand in lacking the perianth bristles and by more depauperated panicles. Ohwi (1942) determined the two Hatusima numbers cited above as *Schoenus laevinux* of northeastern New Guinea. I have seen several Brass and Clemens numbers of *Sch. laevinux* from the type area at the New York Botanical Garden and the Harvard University Herbarium and found it quite different from the Ponape plant at least in the whitish achenes and darker black-brown glumes conspicuously hispid on back, thus resembling those of *Sch. melanostachyus*. Hosokawa (1938) apparently erred in citing his collection, no. 5987 from Nan-a-raut, under *Sch. melanospermus*, which distinctly differs from either *Sch. tendo* or *Sch. laevinux* at least in conspicuously transversely rugose achenes.

59. *Schoenus punctatus* R. Brown, Prodr. Fl. Nov. Holl. 1, 232, 1810.

Cladium aromaticum Merrill in Philip. Journ. Sci. 9: 59, 1914; Kükenth. in Engl., Bot. Jahrb. 59: 7, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 276, 1935.

[Practical descr.] Kükenth. in Repert. Sp. Nov., Fedde, 44: 25, 1938.

MARIANAS: GUAM: south of Piti, 300 m. alt. *McGregor* 492! (BISH, isotype of *Cladium aromaticum*).—Also Thursday Is.

60. *Schoenus calostachyus* (R. Br.) Poiret, Encycl. Meth. Suppl. 2: 251, 1811; Kükenth. in Engl., Bot. Jahrb. 59: 7, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 281, 1935; Ohwi in Journ. Jap. Bot. 18: 136, 1942.

Chaetospora calostachya R. Br., Prodr. Fl. Nov. Holl. 1, 233, 1810.

Schoenus triangularis Volkens in Engl., Bot. Jahrb. 31: 458, 1902.

[Practical descr.] Kükenth. in Fedde's Repert. Sp. Nov. 44: 73, 1938; Ohwi in Mem. Coll. Sci. Kyoto Univ. B, 18: 26, 1944. [Illustr.] Clarke, Illustr. Cyper. t. 78, f. 7–9, 1909; Pl. 4, fig. H of the text.

WEST CAROLINES: YAP: without definite locality. *Kanehira* 1165! (FU), *Volkens* 452 (B, type of *Sch. triangularis*); Tomil Islet. *Hosokawa* 8796! (TAI), *Tuyama* s.n.! (TI).—PALAU: Babelthaob Islet, Nagarathmao, monte Ngeleeleuuus. *Tuyama* s.n.! (TI); Aimiriik. *Tuyama* s.n.! (TI), *Kanehira* & *Hatusima* 4476! (FU); Almonogui. *Hosokawa* 6942! (TAI).—Also Ryukyus, Malaysia and Australia.

61. *Schoenus philippinensis* (Palla) Kükenth. ex Merrill, Enum. Philip. Flw. Pl. 1: 128, 1923.

Schoenus mariannae Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 263, 1935. Syn. nov. e typo.

[Practical descr.] Kükenth. in Repert. Sp. Nov., Fedde, 44: 90, 1938. [Illustr.] Pl. 2; fig. B.

MARIANAS: Alamagan, open grassy place at the sumit of the island. *Hosokawa* 7934! (TAI, holotype of *Sch. mariannae*).—Also Philippines.

In 1959 I saw the type of *Schoenus mariannae* at the herbarium of the National Taiwan University and was convinced that it is identical with *Sch. philippinensis*. It can be readily separated from the very similar *Sch. apogon* by the creeping base of culms rooting at nodes. This latter species is very common everywhere in tropical and subtropical Asia but has never been recorded from Micronesia. The occurrence of *Sch. philippinensis* in Alamagan gives a further example showing the link between Malaysia and western Micronesia.

Genus 12. RHYNCHOSPORA Vahl

1. Inflorescence a corymb or a compound panicle.
2. Coarse plant about 1 m tall; leaves 1-1.5 cm wide; spikelets 7-9 mm long; achenes with subulate beak. 62. *R. corymbosa*.
2. Slender plant about 30 cm tall; leaves canaliculate, less than 2 mm wide; spikelets about 5 mm long; achenes with conical beak. 63. *R. rugosa* ssp. *lavarum* f. *ponapensis*.
1. Inflorescence a head. 64. *R. rubra*.

- 62. Rhynchospora corymbosa** (Linn.) Britton in Trans. N. Y. Acad. Sci. 11: 84, 1892; Safford in Contrib. U.S. National Herb. 9: 366; 1905; Merrill in Philip. Journ. MARIANAS: without definite locality. *McGregor* 461! (US), *Nelson* 313! (BISH); Mt. Santa Rosa, 270 m alt. *Bryan Jr.*! (BISH); 3 miles north of Sumai. *Conover* s.n.! (BISH); 1/2 mile west of Mt. Santa Rosa, *Muennink* s.n.! (US); Atangutano. *Bryan, Jr.* 1065! (BISH); Mt. Alifan, 70 m alt. *Bryan, Jr.* 1206! (BISH).

WEST CAROLINES: PALAU: Aimiriik. *Kanehira & Hatusima* 4489! (FU); Gokkep. *Takamatsu* 1181! (BISH); Babelthaob Islet. *Hosokawa* 7376! (TAI); Korror Islet. *Ledermann* 14173 (B), ditto, Ngarabaket. *Tuyama* s.n.! (TI).—YAP: without definite locality. *Volkens* 279 (B).

EAST CAROLINES: TRUK: without definite locality. *Kanehira* 607! (FU), *Kamiya* s.n.! (TI); Dublon Islet (= Natsu-shima). *Takamatsu* 130 & 291! (BISH); Zogeyashi-rin Islet. *Hosokawa* 6486! (BISH, TAI).—PONAPE: without definite locality. *Ledermann* 15482a! (B, BISH), *Kawagoë* s.n.! (KAG), *Kanehira* 1513! (FU); Parkir Colonia. *Hosokawa* 5902! (BISH, TAI).—Distrib. pantropic.

- 63. Rhynchospora rugosa** (Vahl) Gale in Rhodora 46: 275, t. 835, f. 1 A-B, 1944.

ssp. *lavarum* (Gaudich.) T. Koyama, comb. nov.

Rhynchospora lavarum Gaudich. in Freyc., Voy. Bot. Coq. 415, 1826.

Rhynchospora glauca Vahl ssp. *lavarum* (Gaudich.) Kükenth. in Engl., Bot. Jahrb. 75: 150, 1950.

forma *ponapensis* (Hosokawa) T. Koyama, stat. nov. e typo.

Rhynchospora ponapensis Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 261, 1935; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 432, 1935;

Ohwi in Journ. Jap. Bot. 18: 136, 1942.

Culms slender, up to 30 cm tall, with few filiform leaves. Partial inflorescence born at 2 to 4 nodes, occupying the upper 2/3 of the culm, interrupted. Spikelets corymbose but more or less congested on very short peduncle, elliptic, hardly 5 mm long, rusty-brown. Achenes obovate, 2.25 mm long including beak, the body lenticular, brownish, minutely rugulose, the beak conical, 0.75 mm long, the base 4/5 as wide as the achene body; perianth bristles 3 to 6, the longer slightly longer than the achene body. [Pl. 4; fig. F]

EAST CAROLINES: PONAPE: without definite locality. *Hatusima* 11038 & 11054! (FU); Turnansapoi, in Mt. Nan-a-raut. *Hosokawa* 5981! (TAI, holotype of *R. ponapensis*; BISH, isotype), Mt. Nianai, 2450 ft. alt. *Glassman* 2891! (BISH), at the summit of Nanukawat. *Nakao* s.n.! (TI).—Distribution: endemic.

In 1959 at the herbarium of Bernice P. Bishop Museum I studied a rich collection of *R. lavarum* of the Hawaiian Islands and agreed with Kükenthal to treat it as a subspecies of the widespread *R. rugosa* (= *R. glauca*). Subspecies *lavarum* differs from ssp. *rugosa* in the much depauperated habit with almost spike-like inflorescences, but agrees with the latter in every floral character except for slightly more elongated perianth bristles. *R. ponapensis* from eastern Micronesia well coincides with ssp. *lavarum* in the very depauperated habit, but as it has shorter perianth bristles like those of ssp. *rugosa* it can be segregated from ssp. *lavarum* at the level of forma. Both typical ssp. *lavarum* and its forma *ponapensis* grow in small swamps on mountains, and are separable habitually from ssp. *rugosa* of tropical lowland marshes.

64. ***Rhynchospora rubra* (Lour.) Makino** in Bot. Mag. Tokyo 17: 180, 1903;

Merrill in Philip. Journ. Sci. 9: 62, 1914; Kükenth. in Engl., Bot. Jahrb.

59: 6, 1924; Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 281, 1935;

Ohwi in Journ. Jap. Bot. 18: 136, 1942.

Schoenus ruber Lour., Fl. Cochinch. 41, 1790.

Rhynchospora Wallichiana Kunth, Enum. Pl. 2: 289, 1837; Volkens in Engl., Bot. Jahrb. 31: 458, 1902.

[Practical descr.] Ohwi in Mem. Coll. Sci. Kyoto Univ. B, 18: 16, 1944; Kükenth. in Engl., Bot. Jahrb. 74: 491, 1949. [Illustr.] Makino in Bot. Mag. Tokyo 17: 180, t. 7, f. 1 A-B, 1903.

MARIANAS: GUAM: without definite locality. *McGregor* 412! (US); Mt. Tenjo. *Moore* 77! (US), ditto, 320 m. alt. *Bryan, Jr.* 1101! (BISH); Mt. Santa

Rosa, 270 m. alt. *Bryan, Jr.* 1124! (BISH); between Ylig and Sigua Village, 300 ft. *Steere* 48! (US); 4 km east of Agat. *Necker* 118! (US), & 120! (BISH); south of Agat. *Fosberg* 35222! (BISH, US); south of Assan and Piti, 100 m. alt. *Anderson* 87! (BISH).

WEST CAROLINES: YAP: without definite locality. *Volkens* 327! (B, US), *Fujikawa s.n.*! (TI); Kolonia, Mt. Kabul. *Tuyama s.n.*! (TI); Mt. Matade, 160 m. alt. *Fosberg* 25545! (BISH, US); Balabat. *Takamatsu* 1886! (BISH); Tomil Islet. *Tuyama s.n.*! (TI).—PALAU: Marakar near Korror. *Hatusima* 4701! (FU); Korror Islet. *Kanehira* & *Hatusima* 4694 & 4848! (FU), *Hatusima* 4701! (FU), *Kanehira* 202! (BISH, FU); Korror, Trop. Agr. Exp. Sta. *Hosokawa* 21! (TAI); Babelthaob Islet, Aimiriik. *Hosokawa* 7238! (TAI), *Tuyama s.n.*! (TI); Luise-Almonogui. *Hosokawa* 6825! (TAI); Ngeremetengel. *Fosberg* 32495! (BISH, US); Aulups'el Islet. *Fosberg* 32367! (BISH, US); Almonogui, near Arumaten. *Hosokawa* 6778! (BISH).—Also India, southern China, Ryukyus, southern Japan, Formosa, Malaysia and northern Australia.

Fujikawa's specimens from Yap has viviparous heads. Though this species is the commonest Asiatic beak-rush, it is completely absent from the East Carolines. This gives an idea that western Micronesia including the western Carolines and the Mariana Islands have a phytogeographical link with the Indo-Malaysian region while the eastern Carolines are more closely related to the Oceanic region as exhibited by *Rhynchospora rugosa* ssp. *lavarum* and *Machaerina*.

Genus 13. CAREX Linn.

1. Stigmas 3; achenes and perigynia trigonous; the beak of perigynia recurved.
 2. Staminate part of spikelets longer than the pistillate part; glumes gradually tapering to cuspidate apex without any conspicuous awn. 65. *C. indica*.
 2. Staminate part of spikelets as long as or slightly shorter than the pistillate part; glumes truncate or shallowly emarginate at apex with long scabrous awn. 66. *C. fuirenoidea*.
 1. Stigmas 2; achenes and perigynia lenticular; the beak of perigynia erect. ... 67. *C. brunnea* ssp. *Meyenii*.
- 65. Carex indica** Linn., Mant. Pl. 2: 574, 1771.

'*C. fuirenoidea* Gaudich.': as misapplied by Kanehira in Journ. Fac. Agr. Kyushu Univ. 4: 276, 1935; Ohwi in Journ. Jap. Bot. 18: 138, 1942. [Practical descr.] Kükenth., Cyper.-Caric. in Pfranzenr. 4(20): 262, 1909; Nelmes in Reinwardtia 1: 271, 1951. [Illustr.] Pl. 5: fig. A of the text; Kükenth., l.c. f. 40, 1909.

WEST CAROLINES: PALAU: Kamusetsu. *Hatusima* 4994! (FU); Mt. Elsum. *Hosokawa* 9252! (BISH).—Also India, Indo-China, Malaysia, Solomon Islands, New Caledonia, Fiji and northern Australia.

For the taxonomic discussion see *C. fuirenoides*.

66. ***Carex fuirenoides*** Gaudich. in Freyc., Voy. Bot. Coq. 412, 1826; Safford in Contrib. U.S. National Herb. 9: 210, 1905; Kükenth. in Engl., Bot. Jahrb. 59: 10, 1925; Ohwi in Journ. Jap. Bot. 18: 138, 1942, in part!
C. fuirenoides Gaudich. var. *gracilis* Hosokawa in Trans. Nat. Hist. Soc. Formosa 25: 264, 1935. Syn. nov. e typo.

[Practical descr.] Kükenth., Cyper.-Caric. 287, 1909. [Illustr.] Boott, Illustr. Carex Pt. 4, t. 507, 1864; also Pl. 5: fig. B in the text.

MARIANAS: GUAM: without definite locality. *Guam Exp. Sta. Herb.* 279! (BISH, US); *Gaudichaud*! (P); Tarzan Falls, Manengon, in shade of forest, *Stone 4751!* (GUAM).

WEST CAROLINES: PALAU: Babelthaob Islet, Almonogui, Aimion. *Hosokawa* 6798! (TAI, holotype of var. *gracilis*); Mt. Luis-Almonogui. *Kanehira & Hatusima* 4937! (FU); Sin-Gaspan. *Hosokawa* 9762! (BISH); Makarakol. *Hosokawa* 9279! (BISH, TAI).—Distrib. endemic in Micronesia.

Strikingly resembling *C. indica* this Micronesian endemic differs from it in the glumes that are truncate or shallowly emarginate at the long-awned apex (Pl. 5, fig. B). Kanehira (1935) and Ohwi (1942) apparently failed to find that there are two different Indocarices in Micronesia. Hosokawa's determination on *Carex* sheets in the Taipei herbarium shows that he also misidentified *C. indica* with *C. fuirenoides*. In so doing he redescribed true *C. fuirenoides* as its var. *gracilis* because it is generally slightly slenderer than *C. indica*.

67. ***Carex brunnea*** Thunb., Fl. Jap. 38, 1784.

ssp. ***Meyenii*** (Nees) T. Koyama, stat. nov.

C. Meyenii Nees in Nova Act. Nat. Curios 19, Suppl. 1: 123, 1843.

C. Kanehirae Ohwi in Act. Phytotax. Geobot. 8: 67, 1939, & in Journ. Jap. Bot. 18: 138, 1942.

More or less tufted from short, decumbent rhizome. Leaves narrowly linear, 1.5–4.5 mm wide, stiffish; sheaths brown or fuscous, disintegrating into fibers. Culms slender, almost as long as leaves or slightly exceeding, 5–9-noded, 1.5 mm thick below. Inflorescence a loose panicle with several distant tufts of spikelets; bracts the lower about 2/3 as long as the total inflorescence. Spikelets 3–5-nate, on capillary peduncle, all androgynous, oblong-cylindrical, 1–2.5 (–) cm long, 2–4 mm thick. Glumes ovate, 2.5–3 mm long, rusty-brown, ovate, cuspidate at apex 2/3 to 4/5 as long as perigynium. Perigynia ovate-oblong to ovate-elliptical, 3.8–4 mm long, membranous, slenderly many-nerved, hispid on the upper part and on margins, cuneate at base, gradually tapering above to a beak 0.8–1 mm long, the orifice bidentate. Achenes obovate, lenticular, 1.5 mm long; stigmas 2, caducous.

WEST CAROLINES: PALAU: Aimiriik. *Hatusima* 4979! (FU, type of *C. Kanehirae*); Ngarathmao. *Watanabe* 161! (TI).—Also Hawaiian Islands.

Examining *C. Meyenii* in Hawaii I am convinced that *C. Kanehirae* is

identical with it. As was explained by many authors this Pacific sedge is conspecific with the very variable *C. brunnea*, but is still definable as a good race by the larger glumes attaining more than 2/3 the length of the perigynia. In *C. brunnea* including many Asiatic and Malaysian races the glumes are mostly half as long as the perigynia. Subspecies *Meyenii* as reinterpreted here gives a further example showing the East Caroline and Hawaii phytogeographic link.
